*Developmental Psychobiology and Behavioral Ecology* Elliott M. Blass, 2012-12-06 The previous volume in this series Blass 1986 focused on the interface between developmental psychobiology and developmental neurobiology The volume emphasized that an understanding of central nervous system development and function can be obtained only with reference to the behaviors that it manages and it emphasized how those behaviors in turn shape central development The present volume explores another natural interface of developmental psychobiology behavioral ecology It documents the progress made by developmental psychobiologists since the mid 1970s in identifying capacities of learning and conditioning in birds and mammals during the very moments following birth indeed during the antenatal period These breakthroughs in a field that had previously lain dormant reflect the need to meet the infant where it is in order for behavior to emerge Accordingly studies have been conducted at nest temperature infants have been rewarded by opportunities to huddle suckle or obtain milk behaviors that are normally engaged in the nest In addition there was rejection of the excessive deprivation extreme handling and traumatic manipulation studies of the 1950s and 1960s that yielded information on how animals could respond to trauma but did not reveal mechanisms of normal development In their place has arisen a series of analyses of how naturally occurring stimuli and situations gain control over behavior and how specifiable experiences impose limitations on subsequent development Constraints were identified on the range of interactions that remained available to developing animals as a result of particular events

Flannelly, 2017-04-08 This book provides a new perspective on the association between religious beliefs and mental health The book is divided into five parts the first of which traces the

development of theories of organic evolution in the cultural and religious context before Charles Darwin Part II describes the major evolutionary theories that Darwin proposed in his three books on evolution and the religious sociological and scientific reactions to his theories Part III introduces the reader to the concept of evolutionary psychiatry It discusses how different regions of the brain evolved over time and explains that certain brain regions evolved to protect us from danger by assessing threats of harm in the environment including other humans Specifically this part describes how psychiatric symptoms that are commonly experienced by normal individuals during their everyday lives are the product of brain mechanisms that evolved to protect us from harm the prevalence rate of psychiatric symptoms in the U S general population how religious and other beliefs influence the brain mechanisms that underlie psychiatric symptoms and the brain regions that are involved in different psychiatric disorders Part IV presents the findings of U S studies demonstrating that positive beliefs about God and life after death and belief in meaning in life and divine forgiveness have salutary associations with mental health whereas negative beliefs about God and life after death belief in the Devil and human evil and doubts about one's religious beliefs have pernicious associations with mental health The last part of the book summarizes each section and recommends research on the brain mechanism underlying psychiatric symptoms and the relationships among these brain mechanisms religious beliefs and mental health in the context of ETAS Theory
