

TYPES OF OFFSHORE STRUCTURE

1. FLOATING

These offshore platforms float on the surface of the water and can be moved from one site to another.

Examples of Floating:

- 1.1. *Semi-Submersible* – They are floating structures supported by four or six pillar-like legs known as columns, each with an equal weight distribution. These columns or legs are connected to pontoons, which are enormous basements that float on the water's surface.

- 1.2. *SPAR Platforms* – As an alternative to traditional systems, they are typically constructed as oil platforms for deeper waters. The inside of the cylindrical truss is filled with a denser substance than seawater to decrease the center of gravity and so maintain the structure's vertical stability.

- 1.3. *Drill ships* – It is a ship-like transportable offshore facility that is dedicated to the exploration and drilling of oil and gas resources, with a focus on scientific investigation. It's mostly employed for exploratory and drilling operations at deep and ultra-deep depths.

Garbatov, 2015-09-03 This three volume work presents the proceedings from the 19th International Ship and Offshore Structures Congress held in Cascais Portugal on 7th to 10th September 2015 The International Ship and Offshore Structures Congress ISSC is a forum for the exchange of information by experts undertaking and applying marine structural research The aim of **Marine Concrete** A.L. Marshall, 2013-04-17 Concrete is commonly regarded as a mundane prosaic material whilst the sea is perceived as a fearsome environment endowed with mystery Mystery stems from lack of knowledge and to that extent both concrete and sea have something in common we fall a long way short of knowing enough about them Fortunately we have learned enough from our investigations and experiences to be able to set the limits within which we should operate It is important for the engineer to seek to quantify the effects of the environment on materials and structures so that these can be made safe and adequately durable for their intended economic

life This is especially true for marine structures Thus the primary purpose of this book is to provide a useful synthesis of the behaviour of concrete and concrete structures in the marine environment An outline of the content of the book is provided in the latter part of the first chapter and so will not be anticipated here The chief aim throughout however is to work as far as possible within a context of the appropriate governing physical phenomena giving due consideration to the mathematical relationships between them Moreover without intending to be a design manual an introduction is given to the sources of information which designers are likely to use as well as to structural achievements It is hoped that there should emerge an implicit integration between structure and constituent materials and the surrounding environment

Nonlinear Dynamics of Compliant Offshore Structures Patrick Bar-Avi, 2017-12-04 This monograph provides a general background to the modelling of a special class of offshore structures known as compliant structures External forcing is resisted by buoyancy and tension forces which increase when the structure is slightly offset from its equilibrium The technical development given in this book is presented in such a way as to highlight the adaptability of the modelling and the reader is shown how the techniques described can be applied to a variety of different offshore structures

Frontiers in Offshore Geotechnics III Vaughan Meyer, 2015-05-15 Frontiers in Offshore Geotechnics III comprises the contributions presented at the Third International Symposium on Frontiers in Offshore Geotechnics ISFOG Oslo Norway 10 12 June 2015 organised by the Norwegian Geotechnical Institute NGI The papers address current and emerging geotechnical engineering

challenges facing those working in off *Foundation Engineering Handbook* Hsai-Yang Fang, 2013-06-29 More than ten years have passed since the first edition was published During that period there have been a substantial number of changes in geotechnical engineering especially in the applications of foundation engineering As the world population increases more land is needed and many soil deposits previously deemed unsuitable for residential housing or other construction projects are now being used Such areas include problematic soil regions mining subsidence areas and sanitary landfills To overcome the problems associated with these natural or man made soil deposits new and improved methods of analysis design and implementation are needed in foundation construction As society develops and living standards rise tall buildings transportation facilities and industrial complexes are increasingly being built Because of the heavy design loads and the complicated environments the traditional design concepts construction materials methods and equipment also need improvement Further recent energy and material shortages have caused additional burdens on the engineering profession and brought about the need to seek alternative or cost saving methods for foundation design and construction
