New systems working at RF, microwave, and millimeter wave will give rise to new services for medical, security, home, entertain, and communication industries. Active and Passive Microwave Devices and Circuits are playing an important role in the design of these systems. This special issue of Active and Passive components is devoted towards the design, analysis, and fabrication of Active and Passive components.

In the first paper entitled "Dependence on frequency of the electromagnetic field distribution inside a cylindrical cavity," the authors explain the relevant changes in the electron cyclotron resonance ion source behavior for small variations of the exciting radiation frequency.

The second paper in this issue "Printed antenna arrays with side lobe suppression" investigates approaches and their limitations to minimize side lobes in printed antenna arrays. It also proposes antenna structures with printed pentagonal dipole arrays.

The third paper "Isotropic broad-band E-field probe" discusses the development and characterization of isotropic broad-band E-field probe which has an isotropic reception from 100 MHz to 18 GHz.

In satellite communication networks, the noise performance and the required spectral purity of the low noise band receiver are of the important issues.

The fourth paper "Ka band phase locked loop oscillator for satellite EHF band receiver" deals with the design and fabrication of Ka band phase locked loop oscillator (PLL DRO) with a fundamental frequency 19.250 GHz for satellite EHF band receiver.

The fifth paper "The novel microwave stop-band filter" proposes new band rejection element for implementing stop band filter. This paper also describes the synthesis,

manufacture and testing of fifth-order Chebyshev filters implemented with this band rejection element.

The sixth paper "Passive frequency selective surface array as a diffuser for destroying millimeter wave coherence" proposes the design, construction, and testing of grounded frequency selective surfaces (FSS) as a diffuser for destroying millimeter wave coherence which is used to eliminate speckle in active millimeter wave imaging. The FSS arrays were designed with finite integral technique and fabricated by etching technique. The S-parameter was characterized with a free space MVNA and measurement of radiation patterns was done with a BWO in motorized setup.

In the seventh paper entitled "A new fractal-based design of stacked integrated transformers," novel fractal stacked transformers were analyzed using full-wave EM simulations and compared in terms of the inductance and quality factor. The novel fractal stacked transformers show improved performance over conventional spiral inductor-based transformers.

A novel layout of leaky-wave antennas based on tapered design has been proposed and investigated in the eighth paper "High efficiency and broadband microstrip leaky-wave antenna." This paper also shows that this structure is attractive for the design of high performance microstrip leaky-wave antennas for microwave and millimeter wave applications.

The ninth paper entitled "Material parameter measurements for microwave antireflection coating development" is on the material parameter measurements for microwave antireflection coating development.

Prospects of 4H-SiC double drift region IMPATT device as a photo-sensitive high-power source at 0.7 terahertz frequency regime is presented in the tenth paper entitled
