Real Time Network Management:

Network Management and Control I.T. Frisch,S.S. Panwar,1994-08-31 Three speakers at the Second Workshop on Network Management and Control nostalgically remembered the INTEROP Conference at which SNMP was able to interface even to CD players and toasters We agreed this was indeed a major step forward in standards but wondered if anyone noticed whether the toast was burned let alone would want to eat it The assurance of the correct operation of practical systems under difficult environments emerged as the dominant theme of the workshop with growth interoperability performance and scalability as the primary sub themes Perhaps this thrust is un surprising since about half the 100 or so attendees were from industry with a strong contingency of users Indeed the technical program co chairs Shivendra Panwar of Polytechnic and Walter Johnston of NYNEX took as their assignment the coverage of real problems and opportunities in industry Nevertheless we take it as a real indication of progress in the field that the community is beginning to take for granted the availability of standards and even the ability to detect physical link and network level faults and is now expecting diagnostics at higher levels as well as system wide solutions

Active Networks and Active Network Management

Stephen F. Bush,Amit B. Kulkarni,2006-04-11 Active networking is an exciting new paradigm in digital networking that has the potential to revolutionize the manner in which communication takes place It is an emerging technology one in which new ideas are constantly being formulated and new topics of research are springing up even as this book is being written This technology is very likely to appeal to a broad spectrum of users from academia and industry Therefore this book was written in a way that enables all these groups to understand the impact of active networking in their sphere of interest Information services managers network administrators and e commerce developers would like to know the potential benefits of the new technology to their businesses networks and applications The book introduces the basic active networking paradigm and its potential impacts on the future of information handling in general and on communications in particular This is useful for forward looking businesses that wish to actively participate in the development of active networks and ensure a head start in the integration of the technology in their future products be they applications or networks Areas in which active networking is likely to make significant impact are identified and the reader is pointed to any related ongoing research efforts in the area The book also provides a deeper insight into the active networking model for students and researchers who seek challenging topics that define or extend frontiers of the technology It describes basic components of the model explains some of the terms used by the active networking community and provides the reader with taxonomy of the research being conducted at the time this book was written Current efforts are classified based on typical research areas such as mobility security and management The intent is to introduce the serious reader to the background regarding some of the models adopted by the community to outline outstanding issues concerning active networking and to provide a snapshot of the fast changing landscape in active networking research Management is a very important issue in active networks because of its open nature

The latter half of the book explains the architectural concepts of a model for managing active networks and the motivation for a reference model that addresses limitations of the current network management framework by leveraging the powerful features of active networking to develop an integrated framework. It also describes a novel application enabled by active network technology called the Active Virtual Network Management Prediction (AVNMP) algorithm. AVNMP is a proactive management system; in other words, it provides the ability to solve a potential problem before it impacts the system by modeling network devices within the network itself and running that model ahead of real time.

Network Management

Arpege Group, 2012-12-06

Try to imagine a railway network that did not check its rolling stock track and signals whenever a failure occurred or only discovered the whereabouts of its locomotives and carriages during annual stock taking. Just imagine a railway that kept its trains waiting because there were no available locomotives. Similar thoughts could apply to any transport network of trucks, buses, or taxis covering a wide geographical area. It is quite clear that the quality of service and safety and the cost efficiency of any network depend on the effective and timely management of network resources. The same is true of telecommunications networks. For a long time now, telecommunications networks have been designed and built with remote monitoring and control devices. The very dimensions of networks and the need to intervene rapidly in the event of an incident made these devices imperative. On the other hand, the means of measuring quality of service did not appear till much later. Data transmission networks developed during the 1970s were often designed without any network management features. The technical traditions of the world of information technology had been forged on small systems with just a few dozen terminals spread over a small area. At the time, the extension of networks to cover wide geographical areas was not perceived as a change of dimension.

Web-based Systems and Network Management

Kornel Terplan, 1999-04-21

Web-based technology is rapidly penetrating many business areas, including systems and network management. This new technology is based on the Internet, offering benefits in terms of unification and simplification of systems and network management. Web-based Systems and Network Management is a practical guide to managing Web-based network systems. The first serious book on this subject, based on a three-day seminar developed by the author, demonstrates the use of Web technology and shows how the various components of the Internet and Intranets must be economically and securely managed. Web-based standardization is taking three main directions: Port 280, JavaAPI, and Web-based Enterprise Management. These are discussed in depth, and the opportunities and limitations of each are addressed. The book not only handles the basics but also gives guidance on their use to simplify systems and network

management Broadband Access and Network Management D. W. Faulkner, A. L. Network Management and Control A. Kershenbaum, Manu Malek, M. Wall, 2013-11-11 Like the 120 volt standard for electricity the appearance of standards in network management heralds new opportunities for creativity and achievement As one example within the framework of these evolving standards consider a system of local area networks connecting computing equipment from different vendors A bridge 100 Mb/s up because of a transient caused by a repeater failure The result is a massive disconnection of virtual circuits What is the role of the manager and the network management system in solving the problem How does the vendor implement the solution How does the user use it What measurements should be made How should they be displayed How much of the diagnosis and correction should be automated How does the solution change with different hardware and software In the IEEE Communications Magazine I recently reported a timely illustration in the area of problems in fault management At the workshop hotel I was waiting for a room assignment at the reception desk when my attendant left the counter for a moment Upon returning he took one look at his screen and whined an accusatory question at everyone in sight Who logged out my terminal Who indeed It wasn't any of us It was the system
