

# DEDUCTIVE REASONING

Deductive reasoning is a logical process that involves drawing specific conclusions based on general principles or premises.

## OVERVIEW

Deductive reasoning is a top-down approach to logical thinking where specific conclusions are derived from general principles or premises. It follows a structured format in which if the premises are true and the reasoning is valid, the conclusion must also be true. This type of reasoning is commonly used in mathematics, formal logic, and philosophical thinking.

## EXAMPLE

**Premise 1:** All mammals have lungs.  
**Premise 2:** Dolphins are mammals.  
**Conclusion:** Dolphins have lungs.

In this example, the first premise establishes a general principle that all mammals have lungs. The second premise identifies dolphins as a specific mammal. Using deductive reasoning, we can logically conclude that dolphins must also have lungs.

*Logical Abilities in Children: Volume 3* Daniel N. Osherson, 2017-08-24 Originally published in 1975 this volume 3 of 4 presents an expanded model of certain deductive abilities in children and adults A partial explanation of the growth of these abilities was suggested in Volume 2 of this series and it is amplified here both with regard to propositional logic and the logic of class inclusion A new methodology is employed the issue of the effect of content in deductive reasoning is covered and developmental questions are reformulated Although only data from experiments with adolescents are presented here the volume sets the stage for potentially illustrating developmental comparisons a topic pursued in Volume 4 of this novel and

Halford, 2014-02-25 This work argues that cognitive development is experience driven and processes entailed in acquiring information about the world are analyzed based on recent models of learning and induction The way information is represented and accessed when performing cognitive tasks is considered paying particular attention to the implications of Parallel Distributed Processing PDP models for cognitive development The first half of the book contains analyses of human reasoning processes drawing on PDP models of analogy development of strategies and task complexity all based on aspects of PDP representations It is proposed that PDP representations become more differentiated with age so more vectors can be processed in parallel with the result that structures of greater complexity can be processed This model gives an account of previously unexplained difficulties in children's reasoning including some which were influential in stage theories The second

half of the book examines processes entailed in some representative cognitive developmental tasks including transitive inference deductive inference categorical syllogisms hypothesis testing learning set acquisition acquisition and transfer of relational structures humor hierarchical classification and inclusion understanding of quantity arithmetic word problems algebra conservation mechanics and the concept of mind Process accounts of tasks are emphasized based on applications of recent developments in cognitive science *Handbook of Human Intelligence* Robert J.
