Old Drugs: Confronting Recent Advancements and Challenges Anna Wiktorowska-Owczarek,Magdalena Jasinska-Stroschein,Diego Iacono,2025-04-01 Over the years there has been an increasing demand for an effective and cost efficient drug discovery process The study of old and previously approved drugs for newer indications or their re evaluation based on newly identified different mechanisms of action has become a major focus of drug discovery particularly when it comes to treating chronic or complex multigenetic diseases such as cancer autoimmune neurodegenerative disorders and psychiatric conditions This approach is actually particularly appealing since it saves time and resources and reduces the risk of failure The history of pharmacology is replete with examples of drugs that have undergone significant shifts in their clinical or preventive use over time such as acetylsalicylic acid thalidomide duloxetine and dapagliflozin For instance acetylsalicylic acid has been used for over a century as an anti inflammatory and analgesic but it is currently used as an antiplatelet agent Thalidomide was previously removed from the market because of its teratogenic effects which were associated with the inhibition of the synthesis of tumor necrosis factor alpha and other cytokines but it has since emerged as an immunomodulator for the treatment of various diseases including erythema nodosum leprosum Intriguingly repurposed drugs have also been shown to control synaptic potentiation associated with neurological and psychiatric disorders which have opened unimaginable scenarios a few years ago
