This book is an introductory exposition of different topics that emerged in the literature as unifying themes between two fields of econometrics of time series namely nonlinearity and nonstationarity Papers on these topics have exploded over the last two decades but they are rarely examined together There is undoubtedly a variety of arguments that justify such a separation But there are also good reasons that motivate their combination People who are reluctant to a combined analysis might argue that nonlinearity and nonstationarity enhance non trivial problems so their combination does not stimulate interest in regard to plausibly increased difficulties This argument can however be balanced by other ones of an economic nature A predominant idea today is that a nonstationary series exhibits persistent deviations from its long run components either deterministic or stochastic trends These persistent deviations are modeled in various ways unit root models fractionally integrated processes models with shifts in the time trend etc However there are many other behaviors inherent to nonstationary processes that are not reflected in linear models For instance economic variables with mixture distributions or processes that are state dependent undergo episodes of changing dynamics In models with multiple long run equilibria the moving from an equilibrium to another sometimes implies hysteresis Also it is known that certain shocks can change the economic fundamentals thereby reducing the possibility that an initial position is re established after a shock irreversibility
