Receptor Mediated Endocytosis:

Receptor-Mediated Endocytosis P. Cuatrecasas, T.F. Roth, 2013-11-11 This volume focuses exclusively on those endocytic processes that sequester proteins by a selective receptor mediated mechanism In such an endocytic process cell surface receptors specifically bind protein ligands and localize them to specialized invaginations of the plasma membrane These regions are coated pits so named because they are lined on the cytoplasmic face with an ordered array of the protein clathrin It is this coat which provides their characteristic electron microscopic image Subsequently these regions pinch off to form coated vesicles which rapidly lose their coat and then fuse with other organelles or the plasma membrane The hallmarks of this process are the specific receptors coated pits coated vesicles and an ordered sequence of transit events leading to delivery to selected locations Receptor recognition specific disposition of the endocytosed ligand and the existence of receptor ligand complexes at highest density in coated pits define the process as selective and concentrative This topic has received ever increasing attention during the past few years The evolving mechanisms are especially exciting because they come at a time when the conventional views based on thermodynamic arguments suggest that proteins should not be able to cross into the cell Receptor mediated endocytosis however reconciles the view that biological membranes should be impervious to macromolecules with the evidence that certain macromolecules do gain entrance into the cell During the last few years this field has been stimulated by studies on the uptake and processing of low density lipoproteins LDL by cells

Receptor/Ligand Sorting Along the Endocytic Pathway Jennifer J. Linderman, Douglas A. Lauffenburger, 2013-03-08 This research monograph focuses on a biomolecular separation process that occurs within most cells Two types of molecules receptors and ligands are separated and routed along different intracellular pathways this is a critical step in the process of receptor mediated endocytosis The development of an understanding of the basic mechanisms of this separation process is presented with an emphasis on discovering the fundamental and measurable parameters that influence the event Mathematical models of sorting are evaluated to predict the range of possible outcomes These are compared with a variety of experimental data on different receptor ligand systems In addition the influence of the separation on overall receptor ligand processing dynamics is discussed The book is intended for both biomathematicians and biologists It is not necessary to understand the details of the model equations and their solution in order to test the models experimentally The analysis suggests experiments that might be done to further investigate the sorting process and the text details methods for analyzing these experimental results
