**Use of Services for Family Planning and Infertility, United States, 1982** Gerry E. Hendershot, Marjorie C. Horn, William D. Mosher, 1988 The 1982 statistics on the use of family planning and infertility services presented in this report are preliminary results from Cycle III of the National Survey of Family Growth NSFG conducted by the National Center for Health Statistics Data were collected through personal interviews with a multistage area probability sample of 7969 women aged 15 44 A detailed series of questions was asked to obtain relatively complete estimates of the extent and type of family planning services received Statistics on family planning services are limited to women who were able to conceive 3 years before the interview date Overall 79% of currently married nonsterile women reported using some type of family planning service during the previous 3 years There were no statistically significant differences between white 79% black 75% or Hispanic 77% wives or between the 2 income groups The 1982 survey questions were more comprehensive than those of earlier cycles of the survey The annual rate of visits for family planning services in 1982 was 1077 visits 1000 women Teenagers had the highest annual visit rate 1581 1000 of any age group for all sources of family planning services combined Visit rates declined sharply with age from 1447 at ages 15 24 to 479 at ages 35 44 Similar declines with age also were found in the visit rates for white and black women separately Nevertheless the annual visit rate for black women 1334 1000 was significantly higher than that for white women 1033 The highest overall visit rate was for black women 15 19 years of age 1867 1000 Nearly 2 3 of all family planning visits were to private medical sources Teenagers of all races had higher family planning service visit rates to clinics than to private medical sources as did black women age 15 24 White women age 20 and older had higher visit rates to private medical services than to clinics Never married women had higher visit rates to clinics than currently or formerly married women Data were also collected in 1982 on use of medical services for infertility by women who had difficulty in conceiving or carrying a pregnancy to term About 1 million ever married women had 1 or more infertility visits in the 12 months before the interview During the 3 years before interview about 1 9 million women had infertility visits For all ever married women as well as for white and black women separately infertility services were more likely to be secured from private medical sources than from clinics The survey design reliability of the estimates and the terms used are explained in

**The Infertility Trap** R. John Aitken,2022-05-05 A potential crisis in human fertility is brewing As societies become more affluent they experience changes that have a dramatic impact on reproduction As average family sizes fall the selection pressure for high fertility genes decreases exacerbated by the IVF industry which allows infertility linked genes to pass into the next generation Male fertility rates are low for many reasons including genetics and exposure to environmental toxins So a perfect storm of factors is contriving to drive fertility rates down at unprecedented rates If we do not recognize the reality of our situation and react accordingly an uncontrollable decline in population numbers is likely which we ll be unable to reverse This book will address in a unique and multi faceted way how the consequences of modern life affects fertility so that we can consider behavioural social medical and environmental changes which could reduce the severity of what is about to come

well as current diagnostic tools and treatment options of both natural and assisted conception From diagnosis through treatment Male Infertility Management of Infertile Men in Reproductive Medicine offers expert straightforward guidance on the pathophysiology and management of male infertility for clinicians who assist couples early in the process of trying to conceive Covers diagnostic aspects of male infertility clinical laboratory and imaging methods as well as various therapeutic options including classical and advanced surgical procedures Discusses intrauterine insemination conventional in vitro fertilization intracytoplasmic sperm injection sperm cryopreservation preimplantation genetic testing and more Begins each chapter with key points and ends with clinical scenarios of real life problems and their solutions Shares the knowledge and expertise of global experts in the field Any additional digital ancillary content may publish up to 6 weeks following the publication date
