

Instruments Used in Psychotherapy and Counselling Process Research

In [Chapter 1](#), I presented some of the instruments used for measuring psychotherapy outcome. Many of these instruments are not unknown to practising clinicians as they are used in routine practice either for the assessment or for the monitoring of treatment outcome. Psychotherapy process measuring instruments are less well known as they are typically not very useful for everyday practice (but there are exceptions such as the Core Conflictual Relationship Theme Method; Luborsky & Crits-Christoph, 1998).

Lambert and Hill (1994) classify psychotherapy process research instruments with regard to whether they use the client's view of the process, the therapist's view of the process or the expert's or trained observer's view of the process. Other factors they take into consideration are whether the method gathers information on the client or the therapist, what aspect of the therapeutic process it focuses on (e.g. therapeutic alliance), what type of coding or scaling it uses and what theoretical constructs it examines (e.g. transference).

Heppner, Kivlighan and Wampold (1999) differentiate methods for measuring the area that is being investigated using the seven areas delineated by Hill (1991; see above) and they add Elliott's (1991) concept of *quality* of the process. Furthermore, they distinguish whether the instrument measures one of the outlined areas on a *micro* or a *macro* level, where micro level means that the instrument measures utterances and macro level means that the unit of analysis is either the whole session or its parts.

For the purpose of this book I will utilize the simpler distinction of Greenberg and Pinsof (1986). These authors use a basic division of process methods into *participative* and *non-participative* methods. In participative methods, therapy participants, clients and therapists are the users of the instrument; while non-participative methods use independent observers.

Participative Process Methods

Participative methods assess clients' and therapists' views of their interaction and its impacts. Participative methods can be further divided according to different criteria, e.g. what aspect of the process they assess or what unit of analysis they use (see the division stated above). Here, however, I will present the methods pragmatically according to examples of the most commonly used methods.

Methods of Research in Psychotherapy Louis A. Gottschalk, 2012-12-06 The prospective reader may well ask about the particular merits of this volume especially in view of several dozen similar offerings each with its own excellences and of the easy availability of symposia conferences conventional reviews abstract journals and serial research reports In spite of such other attractions it seems to me that these 34 essays are among the most informative and stimulating which are now available in the areas covered The editors have been successful in attracting new

articles from many of the most prominent investigators now actively working at research in psychotherapy who can therefore speak for themselves about what they are doing Several of the articles have been in the preparatory stage for numerous years Not only do they represent the vanguard of research but because of the introduction of relatively new concepts in communication theory in the clinical setting which can be implemented by the new technology specifically the use of sound films and tape they probably presage the shape of much that is to come It is commonplace that the history of a science is closely allied to the history of the tools available Here we see the concepts attitudes and working methods on this frontier being set forth frankly and concretely in ways which avoid many of the deficiencies and evasions of previous clinical research
