## **Rubias Error:**

*From Attention to Goal-Directed Behavior* Francisco Aboitiz, Diego Cosmelli, 2008-11-21 Attention is a key psychological construct in the understanding of human cognition and the target of enormous efforts to elucidate its physiological mechanisms as the wealth of literature both primary and secondary attests for recent compilations see Itti Rees Paletta Posner 2004 But in addition to asking what attention actually is decomposing and analyzing its varieties or delimiting its neurobiological mechanisms and effects in this volume we want to explore attention somewhat differently We believe that a full fledged theory of attention must consider its workings in the context of motivated goal directed and environmentally constrained organisms That attention is related to goal directed behavior is not news What the contributions to this volume do suggest however is the existence of fundamental links between attention and two key processes that are crucial for adapted conduct go directed behavior and cognitive control Importantly they show that these relations can be explored at multiple levels including neurodynamical neurochemical evolutionary and clinical aspects and that in doing so multiple methodological challenges arise that are worth considering and pursuing The reader will find here therefore a selection of contributions that range from basic mechanisms of attention at the neuronal level to developmental aspects of cognitive control and its

impairments Another trend that will become evident is that in different ways the authors stress the need to understand these issues as they unfold in natural behavior both healthy and pathological thus arguing for a more ecological approach to these questions **Neuroimaging in Developmental Clinical Neuroscience** Judith M.
