Paleodemography Age Distributions From Skeletal Samples:

Paleodemography Robert D. Hoppa, James W. Vaupel, 2008-10-30 Paleodemography is the field of enquiry that attempts to identify demographic parameters from past populations usually skeletal samples derived from archaeological contexts and then to make interpretations regarding the health and well being of those populations However paleodemographic theory relies on several assumptions that cannot easily be validated by the researcher and if incorrect can lead to large errors or biases In this book physical anthropologists mathematical demographers and statisticians tackle these methodological issues for reconstructing demographic structure for skeletal samples Topics discussed include how skeletal morphology is linked to chronological age assessment of age from the skeleton demographic models of mortality and their interpretation and biostatistical approaches to age structure estimation from archaeological samples This work will be of immense importance to anyone interested in paleodemography including biological and physical anthropologists demographers geographers evolutionary biologists and statisticians

Paleodemography Robert D. Hoppa, James W. Vaupel, 2002 Many methodological and theoretical problems exist in reconstructing demographic structure from archaeological populations Paleodemography is an innovative volume which tackles these issues to reach a consensus on the way forward It will be the benchmark for all those interested in skeletal samples and their implications for analysing past populations

foreign material objects pottery obsidian and so on is used to make inferences on ancient trade while population movement can only be assessed when the biological component of an ancient community is analyzed i.e. the human skeletal remains. But the exchange of goods or the presence of foreign architectural patterns does not necessarily imply genetic admixture between groups while at the same time humans can migrate for reasons that may not be related only to trading. The Prehispanic Maya were a complex highly stratified society. During the Classic period city states governed over large regions establishing complex ties of alliance and commerce with the region's minor centers and their allies against other city states within and outside the Maya realm. The fall of the political system during the Classic period, the Maya collapse, led to hypothetical invasions of leading groups from the Gulf of Mexico into the northern Maya lowland at the onset of the Postclassic. However, it is still unclear whether this collapse was already underway when this movement of people started. The whole picture of population dynamics in Maya Prehispanic times during the Classic and the Postclassic can slowly emerge only when all the pieces of the puzzle are put together in a holistic and multidisciplinary fashion. The contributions of this volume bring together contributions from archaeology, archaeometry, paleodemography, and bioarchaeology. They provide an initial account of the dynamic qualities behind large scale ancient population dynamics and at the same time represent novel multidisciplinary points of departure towards an integrated reconstruction and understanding of Prehispanic population dynamics in the Maya region.

Human Bioarchaeology of the Transition to Agriculture Ron Pinhasi, Jay T. Stock, 2011-06-24

A holistic and comprehensive account of the nature of the transition from hunting to farming in prehistory. It addresses for the first time the main bioarchaeological aspects such as changes in mobility, behaviour, diet, and population dynamics. This book is of major interest to the relevant audience since it offers for the first time a global perspective on the bioarchaeology of the transition to agriculture. It includes contributions from world class researchers with a particular emphasis on advances in methods e.g. ancient DNA, of pathogens, stable isotope analysis, etc. The book specifically addresses the following aspects associated with the transition to agriculture in various world regions: Changes in adult and subadult stature and subadult growth profiles; Diachronic trends in the analysis of functional morphological structures: craniofacial vault, lower limbs, etc. and whether these are associated with change in overall sex specific morphological variability; Changes in mobility; Changes in behaviour which can be reconstructed from the study of the skeletal record. These include changes in activity patterns, sexual dimorphism, evidence of inter personal trauma and the like. Population dynamics and microevolution by examining intra and inter population variations in dental and cranial metric traits as well as archaeogenetic studies of ancient DNA e.g. mtDNA markers.
