The massive increase in consumer product waste, its toxicity, and the complexity of materials have created an unbearable financial and management burden for municipal officials; it has become untenable. We have outgrown the era of municipalities being solely responsible for recycling. A paradigm shift is needed. The concepts of Extended Producer Responsibility and Product Stewardship play a significant role in bringing our consumption of natural resources and emission of greenhouse gases back into balance with the earth's ability to absorb these impacts. *Perspectives on Product Stewardship* provides an overview on managing products throughout their life cycles in order to conserve resources, decrease environmental impact, and share the burden of responsibility. It gives the reader a broad understanding of the origins and evolution of the rapidly expanding field of product stewardship and extended producer responsibility while providing exemplary and precautionary case studies on paint, batteries, and packaging.

Structural Biology for Virus Research Akio Adachi, Yasuyuki Miyazaki, Masako Nomaguchi, Mikako Fujita, Viruses are absolutely and strictly dependent on target host cells for their replication However they have their own unique strategies at each replication step from the entry into cells transcription translation assembly of viral genome proteins and up to the release of progeny virions from cells We virologists have to understand these complex biological interactions between viruses and host cells Importantly extensive studies based on bio structural technology have revealed in succession the detailed and bottom line mechanisms of viral replication processes otherwise impossible We now know the highly dynamic nature of viral genome proteins and are impressed by their ingeniously organized functionality in hostile host environments For characterization of viruses as a unique genetic entity and pathogenic agent it has been critical to investigate thoroughly the individual viral components and host factors involved in the virus replication cycle Because many viral and cellular factors essential for viral replication and pathogenicity have been newly discovered through the efforts of virologists the necessity of contribution to the progress of virology by the structural biology is now greatly increasing To fully understand precise mechanisms underlying the functional interaction of viral and host molecules needless to say it is crucially required to have their structural information We need to know molecular details of the nucleic acids proteins and interacting molecules The information indispensable for understanding certain biological phenomena may only be provided by high resolution three dimensional structures Of note a number of anti viral drugs have been generated based on the structural information The interacting interfaces between virus and host components which are important for viral replication can be potent targets for anti viral drugs Their structural characterization would lead to designing rigid anti viral drugs and or vaccines In this Research Topic we wish to summarize and review what the structural biology has accomplished so far to resolve the important virological issues We also wish to describe the perspective of the structural biology for the future virology Finally the presentation of ongoing original works is greatly encouraged
