Editorial introduction to Part 1

Individual identification (individual-ID) of free-ranging animals has become a central tenet of studying many dimensions of animal behavior and ecology. It is often achieved through photographic means (photo-ID), where a photograph of an individually recognizable animal constitutes the sighting and marking–recapture event. This provides a powerful means of investigating animal sociality and various aspects of their population ecology. The adaptiveness of this approach in conjunction with its minimal intrusiveness makes it a tool of choice in many field studies, both marine and terrestrial. It has been applied across species and habitats, gathering a large variety of information, such as population parameters, processes and trends (e.g., Karanth 1995; Welch and Parker 2016; Chan and Karczmarski 2017; Gabriele et al. 2022), group dynamics, social behavior and social structure (e.g., Karczmarski et al. 2005; Wittemyer et al. 2005; Cantor et al. 2012; Rubenstein et al. 2015), movement, geographic range and range use pattern (e.g., Wittemyer et al. 2007; Rendell et al. 2014; Lee and Bolger 2017; Tang et al. 2021), and many other aspects of animals' daily lives (e.g., Lehmann and Boesch 2008; Crofoot et al. 2011; Cantor et al. 2016; Wrangham et al. 2016; Müller et al. 2018; Turner et al.

2021). It is largely thanks to the effective application of individual identification and mark–recapture techniques that our understanding of mammalian ecology, behavior, and socio-demographic processes have advanced so remarkably in the past half-a-century (Whitehead 2008; Clutton-Brock and Sheldon 2010).

Photo-ID research, however, remains among the most labor-intensive within the field of animal ecology, as processing the photographic material collected during field surveys consumes innumerable hours of painstaking dedicated effort. While recent advances in digital photography have greatly improved the efficiency of gathering data, many high-quality digital photographs obtained at low-cost result in vast amounts of data accumulated over short time periods. Under such circumstances, efficient data processing and management becomes a challenge. Lately, however, rapid advances in automated pattern-recognition and machine-learning algorithms have been catching up with current state-of-the-art digital photography, opening up this field of research to new possibilities and ideas of how to further improve the efficiency of field data collection (e.g., Schofield et al. 2019; Batchner et al. 2021; Machado and Cantor 2022), broaden the type, array and geographic scale of data collected during any given field day (e.g., Rieucau et al. 2018; Schneider et al. 2019; Khan et al. 2022), and—importantly—improve the efficiency of processing the individual-ID data immediately upon the completion of a field day (e.g., Lahiri et al. 2011; Guo et al. 2020; Thompson et al. 2022) and ensure the reliability of identification systems across long time-scales (e.g., Bodesheim et al. 2022; Cheeseman et al. 2022; Tyson Moore et al. 2022). Other photographic applications also received a fresh breath of new ideas, such as photogrammetry (e.g., Galimberti et al. 2019; Gray et al. 2019; Shirane et al. 2020; O'Connell-Rodwell et al. 2022; Richardson et al. 2022) or biodiversity and monitoring surveys (e.g., Miao et al. 2019; Tabak et al. 2019; Howell et al. 2022; Sun et al. 2022; Rydell
