Crop Physiology Abstracts ,1996 Advances In Plant Physiology (Vol. 4) A. Hemantaranjan,2002-07-01 Researches have made tremendous progress in the area of Plant Physiology greatly increasing our understanding of living processes necessary for biotechnological research Different volumes of the treatise Advances in Plant Physiology covers the entire spectrum of Plant Physiology including the Plant Molecular Biology in order to encourage meaningful research in the coming twenty first century The true endeavor in this direction is the result of comprehensive authoritative and timely publication of this valuable treatise provides the reader with the most recent information views and references focused on individual topics through a rich collection of reviews contributed by pioneer workers and of those actively engaged in the studies of various specific areas in different parts of the world with extensive experience established record of eminence and noted authorities In fact this treatise is a treasure for interdisciplinary exchange of information and the approach to topic ranges from theoretical to applied molecular to organismic and single to multivariable systems Apart from fulfilling the need of this treatise for research teams and scientists actively working in the areas of plant physiology biochemistry and plant molecular biology in universities institutes and research laboratories throughout the world it would be extremely a useful book and a voluminous reference material for acquiring advanced knowledge by students in response to innovative courses in Plant Physiology Plant Biochemistry Agronomy Genetics and Plant Breeding Genetic Engineering Microbiology Plant Biotechnology and Botany Over eighteen 18 chapters of Vol 1 extensively elucidate the needful topics of Biological Nitrogen Fixation Plant Cell and Tissue Culture Plant Metabolism certain rare Techniques in Plant Physiology Herbicides Physiology Plant Growth Regulators Physiology of Rooting Tree Physiology Stress Physiology in part and Growth and Development Hopefully Vol II will comprise other important topics **Blue Light Effects in Biological Systems** H. Senger,2012-12-06 Four years ago The Blue Light Syndrome was published as the Proceed ings of the 1 st International Conference on the Effect of Blue Light in Plants and Microorganisms Subsequently the interest in this fascinating and growing field of re search has further increased as is reflected by numerous publications Blue light effects cover such a wide spectrum of organisms responses and methods that communication among scientists with backgrounds in biology biochemistry and biophysics is particularly necessary These facts not only justified but demanded calling the Blue Light Family together again In spite of many fmancial problems the second confer ence attracted 113 active members from 19 countries The 2nd International Conference on The Effect of Blue Light in Plants and Microorganisms was held in July 1984 like the first at the University of Marburg The organizer could again rely on the help of the International Advisory Committee W Briggs Stanford M Furuya Tokyo J Gressel Rehovot S Miyachi Tokyo W Rau Miinchen J Schiff Waltham P S Song Lubbock The very generous financial as sistence from the DFG and the support of the Philipps Universitat Mar burg and its Sonderforschungsbereich Zellenergetik and Zelldifferen zierung were the prerequisites to organizing the conference The present book consists of 56 original papers The partitioning

into eight chapters is always a problem. The grouping of different aspects of the papers into these chapters has not always been obvious so that one or the other contribution could possibly fit in another chapter.

Biochemical Aspects of Crop Improvement K. R. Khanna, 2024-12-06 This book provides a comprehensive review at the biochemical and molecular level of the processes and techniques that contribute to crop improvement. General topics include a historical perspective of the advancements in crop improvement, cultivar systematics and biochemical and molecular markers in crop improvement programs, the genetics of physiological and biochemical processes affecting crop yield, the genetics of photosynthesis, chloroplast relevant enzymes and mutations, osmoregulation adjustment and the production of protective compounds in relation to drought tolerance and the biochemistry of disease resistance including elicitors, defense response genes, their role in the production of phytoalexins and other strategies against pathogens. Other topics include quality breeding, e.g. molecular gene structure, changing individual amino acids, enhancing nutritive value of proteins and biotechnology, genetic engineering. Geneticists, biochemists, botanists, agricultural specialists and others involved in crop improvement and breeding should consider this volume essential reading.

Advances in Botanical Research, 1986-01-31 Advances in Botanical Research provides an up to date source of information for students, lecturing staff and research workers in plant sciences. The topics discussed in Volume 12 span a wide area ranging from the biochemical mechanisms involved in the light modulation of enzyme activity to the phylogenetic significance of the dinoflagellate chromosome. This series specializes in articles evaluating particular areas of advanced botany and as such continues to be of interest to botanists in a variety of research areas. From the Preface: The changes in enzyme activity in green plants caused by the transition from light to dark are now regarded as important regulatory processes directing metabolism towards synthesis of sugars and storage compounds in the light and their breakdown in the dark. Light affects chloroplast enzyme activity in a number of diverse ways through alteration of stromal pH, ion and metabolite levels. However, there are also changes in activity in some enzymes that involve post translation, probably covalent modification of the enzyme protein and these are generally referred to as light modulation. In her article, Anderson reviews such plant enzyme systems, the biochemical mechanisms involved, probably by reduction of a disulphide bond, their potential molecular basis and the function of modulation in photosynthetic carbon metabolism. One of the most important developments in plant molecular genetics is the rapid improvement of our understanding of the nature and mechanisms of mutation induced by transposable elements. It is interesting to reflect that the origins of this lie in our fascination for variegated plants as horticultural curiosities. Because of our increasing interest in transposable elements for exploring the genetic origins of variation or as systems for molecular biology and genetic engineering, the review of Plant Transposable Elements by the group at the Max Planck Institute, Kln, Nevers, Shepherd and Saedler is particularly welcome. How transposons will be used to isolate genes known only for their phenotypic effects will be seen in the future. The unicellular dinoflagellates are major components of marine and freshwater ecosystems. Apart from their general ecological

importance there are a number of reasons why they are of interest to biologists In this volume we consider two such aspects The article by Sigee discusses the very high level of DNA possessed by these organisms the particular configuration of their chromatin and their nuclear organisation These are of phylogenetic significance and to summarise the position as presented in Sigee's article it now seems that dinoflagellates are to be regarded as true eukaryotes with some prokaryote features and that probably they are primitive rather than degenerate forms of more advanced ancestors Algae that can produce toxins effective against animals are found in three of the eight algal divisions including the dinoflagellates Carmichael reviews various aspects of biology and chemistry of these chemically diverse toxins some of which can exert potent effects on humans and considers their potential natural role Few ideas of such ecological roles appear to have been subject to critical experimentation and this article should provide a framework for such future work **Physiology of Stressed Crops, Vol. 4** U S Gupta, 2024-11-01 To cope with the abiotic stress induced osmotic problems plants adapt by either increasing uptake of inorganic ions from the external solution or by de novo synthesis of organic compatible solutes acting as osmolytes Of the osmoregulators and protectants discussed in this volume trehalose fructans ectoine and citrulline which are generated in different species in osmotically ineffective amounts mitigate the stress effects on cells plants and improve productivity There are several pieces of encouraging research discussed in this volume showing significant improvement in stress tolerance and in turn productivity by involving genetic engineering techniques **Plant Growth Regulator Abstracts**, 1981 **Carbon Dioxide and Metabolic Regulations** G. C4 Plant Biology ,1998-12-21 Due to many issues related to long term carbon dynamics an improved understanding of the biology of C4 photosynthesis is required by more than the traditional audience of crop scientists plant physiologists and plant ecologists This work synthesizes the latest developments in C4 biochemistry physiology systematics and ecology The book concludes with chapters discussing the role of C4 plants in the future development of the biosphere particularly their interactive effects on soil hydrological and atmospheric processes

Weed Physiology Stephen O. Duke,2018-01-18 Volume 2 deals with the mechanisms of herbicide action and of resistance and tolerance to herbicides The first five chapters of this volume cover the effects of herbicides and adjuvants on the physiology of plants Professor Black s chapter begins by covering the effects of herbicides on photosynthesis including photosynthetic assimilation of nitrogen sulfur and phosphorus This is followed by Dr Morelands chapter on herbicide

interactions with plant respiration The third chapter by Professor Bartels deals with the effects of herbicides on chloroplast and cellular development with emphasis on correlating physiological information with ultrasound effects *Complex Biological Systems* Irina R. Fomina, Karl Y. Biel, Vladislav G. Soukhovolsky, 2018-10-18 Written and edited by some of the most well respected authors in the area of the adaptation of plants and animals to climate change this groundbreaking new work is an extremely important scientific contribution to the study of global warming Global climate change is one of the most serious and pressing issues facing our planet Rather than a silver bullet or a single study that solves it the study of global climate change is like a beach with each contribution a grain of sand gathered together as a whole to create a big picture moving the science forward This new groundbreaking study focuses on the adaptation and tolerance of plants and animal life to the harsh conditions brought on by climate change or global warming Using the papers collected here scientists can better understand global climate change its causes results and ultimately the future of life on our planet The first section lays out a methodology and conceptual direction of the work as a whole covering the modeling approaches and the impacts studied throughout the book The second section focuses on certain hypotheses laid out by the authors regarding how plants and animal life can adapt and survive in extreme environments The third section compiles a series of ecological experiments and their conclusions and a final section is dedicated to previous scientific breakthroughs in this field and the scientists who made them Whether for the scientist in the field the student or as a reference this groundbreaking new work is a must have Focusing on a small part of the global climate change beach this grain of sand is an extremely important contribution to the scientific literature and a step forward in understanding the problems and potentialities of the issue **Plant Respiration: Metabolic Fluxes and Carbon Balance** Guillaume Tcherkez, Jaleh Ghashghaie, 2018-02-20 There are currently intense efforts devoted to understand plant respiration from genes to ecosystems and its regulatory mechanisms this is because respiratory CO₂ production represents a substantial carbon loss in crops and in natural ecosystems Thus in addition to manipulating photosynthesis to increase plant biomass production minimization of respiratory loss should be considered in plant science and engineering However respiratory metabolic pathways are at the heart of energy and carbon skeleton production and therefore it is an essential component of carbon metabolism sustaining key processes such as photosynthesis The overall goal of this book is to provide an insight in such interactions as well as an up to date view on respiratory metabolism taking advantage of recent advances and concepts from fluxomics to natural isotopic signal of plant CO₂ efflux It is thus a nonoverlapping complement to Volume 18 in this series Plant Respiration From Cell to Ecosystem which mostly deals with mitochondrial electron fluxes and plant scale respiratory losses **Metabolic Regulation of Diatoms and Other Chromalveolates** Benoit Schoefs, Hanhua Hu, Justine Marchand, Kalina M. Manoylov, 2022-05-26 *Classic Papers*, 2004-07-02 Advances in Ecological Research was first published in 1962 and has become one of Academic Press most prestigious and successful series In 1999 the Institute for Scientific Information released figures indicating this serial has an

impact factor of 9.6 and a half life of 10.0 years ranking it first in the highly competitive category of Ecology. This volume continues to publish topical and important reviews and interprets ecology to include all material that contributes to our understanding of the field. *Advances in Ecological Research* presents a wide range of papers on all aspects of ecology. Topics include the physiology, populations and communities of plants and animals as well as landscape and ecosystem ecology.

Advances in Bioclimatology 1 R.L. Desjardins, R.M. Gifford, T. Nilsson, E.A.N. Greenwood, 2012-12-06. Atmospheric carbon dioxide concentration has increased globally from about 280 ppm before the Industrial Revolution (Pearman 1988) to about 353 ppm in 1990. That increase and the continuing increase at a rate of about 1.5 ppm per annum, owing mainly to fossil fuel burning, is likely to cause change in climate, in primary productivity of terrestrial vegetation, managed and unmanaged, and in the degree of net sequestration of atmospheric CO₂ into organic form. The quantitative role of the latter in attenuating the increase in atmospheric CO₂ concentration itself is an important but uncertain element of the global carbon cycle models that are required to predict future increases of atmospheric CO₂ concentration. In my experience, in workshops and other multidisciplinary gatherings, argument arises in discussion of this topic among different groups of scientists such as bioclimatologists, plant physiologists, biogeochemists and ecologists. Plant concentration physiologists are often impressed by the positive effect of higher CO₂ on plant growth under experimental controlled environments and argue that this would be at least partly expressed in the field for many species and communities. *Advances in Ecological Research*, 1989-11-07. Volume 19 in this prestigious series is the second under the new editorial team and benefits once again from their own special interests. The scope of this volume is wide, spanning aspects of plant-insect interactions and arthropod population dynamics to palaeobotany, the evolution of photosynthesis and marine community ecology. Of particular topical interest is an article on the impact of rising levels of atmospheric carbon dioxide on tree physiology.

Photoassimilate Distribution: Plants and Crops: Source-Sink Relationships Eli Zamski, Arthur A. Schaffer, 2017-09-29. Adopting an interdisciplinary approach to the study of photoassimilate partitioning and source-sink relationships, this work details the major aspects of source-sink physiology and metabolism, the integration of individual components and photoassimilate partitioning, and the whole-plant source-sink relationships in 16 agriculturally important crops. The work examines in detail the components of carbon partitioning such as ecology, photosynthesis, loading, transport, and anatomy, and discusses the impact of genetic, environmental, and agrotechnical factors on the parts of whole-plant source-sink physiology.
