

Movement

3.7. Movements (1): Flexion: Ask the patient to bend the head forward. Normally the chin can be brought down to touch the region of the sternoclavicular joints. The chin-chest distance may be measured for record purposes.

3.8. Movements (2): Extension: Ask the patient to tilt the head backward. The patient should be seated (preferably in a high-backed chair) and erect. The plane of the nose and forehead should normally be nearly horizontal, but guard against contributory thoracic and lumbar spine movements.

3.9. Movements (3): Receding motion in the cervical spine with any accuracy is difficult, but may be attempted using a spatula in the clenched teeth as a pointer. Stand back, and ask the patient to flex the head forward. Line up the legs of a goniometer with the spatula and the horizontal, respectively. Read off the included angle.
Normal range = 80°.
