

Radiation Effects on Semiconductor Devices:

- Semiconductor devices are affected by 2 general types of radiation damage:
 - **Displacement Damage:** Where incident radiation displaces Si atoms from their lattice sites which alters the electric characteristics of the crystal.
 - **Ionization Damage:** When a high-energy particle travels through a semiconductor, it leaves an ionized track behind. Energy absorbed by the electric ionization in insulating layers (ex. SiO_2) pushes out charge carriers which leads to unintended concentrations of charge. This in turn creates parasitic fields inside the device.
- *Note: Devices vary in their sensitivity to these effects; it depends primarily on the type of radiation encountered and the nature to the specific device.*
