Reactions And Processes:

Chemical Reactions and Processes Under Flow Conditions Santiago V. Luis, Eduardo García-Verdugo, 2010

Pharmaceutical and fine chemical products are typically synthesised batchwise which is an anomaly since batch processes have a series of practical and economical disadvantages. On the contrary, flow continuous processes present a series of advantages leading to new ways to synthesise chemical products. Flow processes enable control reaction parameters more precisely: temperature, residence time, amount of reagents and solvent etc, leading to better reproducibility, safer and more reliable processes. They can be performed more advantageously using immobilized reagents or catalysts, improve the selectivity and productivity of the process and possibly even the stability of the catalyst. They offer opportunities for heat exchange and energy conservation as well as an easy separation and recycling of the reactants and products by adequate process design. They achieve multistep syntheses by assembling a line of reactors with minimum or no purification in between two reaction steps. They can be assured by facile automation, scale up can be easily conducted by number up. With all the new research activity in manufacturing chemical products, this comprehensive book is very timely as it summarises the latest trends in organic synthesis. It gives an insight into flow continuous processes, outlining the basic concepts and explaining the terminology of and systems approach to process design, dealing with both homogeneous and heterogeneous catalysis and mini or micro reactors. The book contains case studies, extensive bibliographies and reference lists in each chapter to enable the reader to grasp the contents and to go on to more detailed texts on specific subjects if desired. The book is written by both organic chemists and engineers, giving a multidisciplinary vision of the new tools and methodologies in this field. It is essential reading for organic chemists in industry or academia, working alongside chemical engineers or who want to undertake chemical engineering projects. It will also be of interest for chemical engineers to see how basic engineering concepts are applied in modern organic chemistry.

The Structure and Reaction Processes of Coal K. Lee Smith, L. Douglas Smoot, Thomas H. Fletcher, Ronald J. Pugmire, 2013-06-29. Founded on the work of the renowned Advanced Combustion Engineering Research Center, the authors document and integrate current knowledge of the organic and inorganic structure of coal and its reaction processes. With the urgent need for cleaner, more efficient use of this worldwide fuel, their work will set a clear course for future research.

Reactions and Processes ,2014-03-12 Environmental Chemistry is a relatively young science Interest in this subject however is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary discipline there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment A major purpose of this series on Environmental Chemistry therefore is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment The industrial activities of man have given a new dimension to Environmental Chemistry We have now synthesized and described over five million chemical compounds and chemical industry produces about hundred and fifty million tons of synthetic chemicals annually We ship billions of tons of oil per year and through mining operations and other geophysical modifications large quantities of inorganic and organic materials are released from their natural deposits Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas Much of the chemical products and waste products of modern society are released into the environment either during production storage transport use or ultimate disposal These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems
