Semantics Of Time:

Semantics and Experience Hoyt Alverson, 1994 Are there universal as well as culturally particular experiences and expressions of time Hoyt Alverson questions the widely held anthropological assumption that temporal expression and experience represent little more than local cultural constructions Drawing on extensive data from four widely divergent languages and cultures English Mandarin Hindi and Sesotho he argues that people everywhere experience time in fundamentally similar ways Semantics and Experience reveals not only how such expressions vary as a function of ideological and cultural differences but also how despite these differences they reveal a basic similarity that points to their origin in a pan human approach to the construction and cognition of space

A Semantic Time Framework for Interactive Media Systems Eric Lee, 2007

Operational Semantics for Timed Systems Heinrich Rust, 2005-03-31 This monograph is dedicated to a novel approach for uniform modelling of timed and hybrid systems Heinrich Rust presents a time model which allows for both the description of discrete time steps and continuous processes with a dense real number time model The proposed time model is well suited to express synchronicity of events in a real number time model as well as strict causality by using uniform discrete time steps Thus it integrates and reconciles two views of time that are commonly used separately in different application domains In many discrete systems time is modelled by discrete steps of uniform length in continuous systems time is seen as a dense flow The main idea to integrate these different views is a discretization of the dense real number time structure by using constant infinitesimal time steps within each real number point in time The underlying mathematical structure of this time model is based on concepts of Non standard Analysis as proposed by Abraham Robinson in the 1950s The discrete modelling i.e. the description of sequential discrete algorithms at different abstraction levels is done with Abstract State Machines along the formalisms developed by Yuri Gurevich and temporal logic These ingredients produce a rich formal basis for describing a large variety of systems with quantitative linear time properties by seamless integration refinement and embedding of continuous and discrete models into one uniform semantic framework called Non standard Timed Abstract State Machines NTASM

The Semantics of Science Roy Harris, 2005-06-15 The Semantics of Science proposes a radical new rethinking of science and scientific discourse Roy Harris argues that supercategories such as science art religion and history are themselves verbal constructs and thus language dependent Because each supercategory is constructed differently it is necessary to pay attention to the linguistic process by which a discourse such as science has developed Through this view it is possible to observe that the function of the supercategory is to integrate what would otherwise be separate activities and enquiries and the result of this integration is therefore a re drawing of the intellectual world that society as a whole adopts In the course of his study of The Semantics of Science Roy Harris looks at the history and development of scientific discourse to show through language that what is meant by science has changed since it was first theorised by the Greeks Harris traces the semantic development of science through the years of the Royal Society to the present day moving on to an analysis of rhetoric mathematics common sense and finally the supercategory of semantics This lucidly written yet radical new theory on the language of science will be fascinating reading for academics and students researching semantics semiotics or applied linguistics

Semantics, Tense, and Time

Peter Ludlow, 1999-09-03 According to Peter Ludlow there is a very close relation between the structure of natural language and that of reality and one can gain insights into long standing metaphysical questions by studying the semantics of natural language In this book Ludlow uses the metaphysics of time as a case study and focuses on the dispute between A theorists and B theorists about the nature of time According to B theorists there is no genuine change but a permanent sequence of events ordered by an earlier than later than relation According to the version of the A theory adopted by Ludlow a position sometimes called presentism there are no past or future events or times what makes something past or future is how the world stands right now Ludlow argues that each metaphysical picture is tied to a particular semantical theory of tense and that the dispute can be adjudicated on semantical grounds A presentism compatible semantics he claims is superior to a B theory semantics in a number of respects including its abilities to handle the indexical nature of temporal discourse and to account for facts about language acquisition Along the way Ludlow develops a conception of E type temporal anaphora that can account for both temporal anaphora and complex tenses without reference to past and future events His view has philosophical consequences for theories of logic self knowledge and memory As for linguistic consequences Ludlow suggests that the very idea of grammatical tense may have to be dispensed with and replaced with some combination of aspect modality and evidentiality

Formal Development of a Network-Centric RTOS

Eric Verhulst, Raymond T. Boute, José Miguel Sampaio Faria, Bernhard H.C. Sputh, Vitaliy Mezhyuev, 2011-08-23 Many systems devices and appliances used routinely in everyday life ranging from cell phones to cars contain significant amounts of software that is not directly visible to the user and is therefore called embedded For coordinating the various software components and allowing them to communicate with each other support software is needed called an operating system OS Because embedded software must function in real time RT a RTOS is needed This book describes a formally developed network centric Real Time Operating System OpenComRTOS One of the first in its kind OpenComRTOS was originally developed to verify the usefulness of formal methods in the context of embedded software engineering Using the formal methods described in this book produces results that are more reliable while delivering higher performance The result is a unique real time concurrent programming system that supports heterogeneous systems with just 5 Kbytes node It is compatible with safety related engineering standards such as IEC61508
