*Low-Calorie Foods and Food Ingredients* R. Khan, 2012-12-06 amounts can produce a deleterious effect on animals In an attempt to quantify this potential for toxicity and to give sufficient margin for safety JECFA has introduced an acceptable daily intake ADI level for food additives For example the ADI values granted for saccharin aspartame cyclamate acesulfame K and sucralose are 2.5, 40, 11, 9 and 1, 3, 5 mg/kg body weight per day respectively Chapter 2 on regulatory aspects of low calorie food elaborates these points The additives that are to be consumed in large amounts such as a fat replacement product like Olestra or a new bulking material like polydextrose present a more complex problem as far as the evaluation of their toxicity is concerned Normal safety testing of an additive such as a high intensity sweetener requires that the test animals are fed with a sufficiently high dosage in order to produce an effect and then on that basis an ADI value is calculated In cases like Olestra and polydextrose which are not normally present in diet or metabolised to dietary constituents such an approach will obviously not be applicable or of any use in calculating an ADI value Due to these factors the regulatory authorities have not yet been able to produce any guidelines for toxicity trials for additives that are to be taken in food in large quantities

**The Cambridge Diet** J. Marks, A.N Howard, 2012-12-06 Obesity in affluent countries continues to

be a serious problem When one runs an Obesity Clinic there appears to be an unending series of patients who need help Our understanding of weight control has been advanced not only by the studies of obese patients but also by our investigation of the problems of weight gain in young women with anorexia nervosa Just as among obese patients there is the group of efficient metabolizers who can maintain their excessive weight with a calorie intake occasionally as low as 600 kcal per day so we have demonstrated that among anorexic women there are a few who may fail to gain normal weight with 3500 kcal per day Some of the latter group may in fact develop T3 tri iodothyronine thyrotoxicosis One of the major unknown factors is still what determines when patients may be at these extremes If we knew how to control these extremes we would like for a time to switch each to the opposite end of the spectrum One factor which is becoming apparent from studying people in the machine which continually plots metabolic rate is that the metabolic response to food is a major factor in determining a person's weight In general terms there is a tendency for those who are below their ideal weight to have an increased metabolic response to food and those who are above ideal weight to have a reduced metabolic response to food
