Optical Bistability 2 Charles M. Bowden, Hyatt M. Gibbs, Samuel L. McCall, 2012-12-06 This volume is a collection of experimental and theoretical papers presented at the international Topical Meeting on Optical Bistability held at the University of Rochester June 15 17 1983 sponsored jointly by the Air Force Office of Scientific Research the Army Research Office and the Optical Society of America The Conference which had 150 attendees overlapped on June 15 with the Fifth Rochester Conference on Coherence and Quantum Optics with two joint sessions Some of the topics covered in this volume are also treated in the Proceedings of that Conference Since the last international conference on Optical Bistability held in Asheville North Carolina June 3 5 1980 there have been new and important fundamental advances in the field This is borne out in papers in this volume dealing with optical chaos and period doubling bifurcations leading to chaos as well as the report of results of an experiment using a very simple system exhibiting absorptive optical bistability in a ring cavity using optically pumped sodium atoms which was successfully analyzed quantitatively by a simple theory Other advances discussed here include the observation of optical bistability due to the effect of radiation pressure on one mirror of a Fabry Perot cavity and the prediction of mirrorless intrinsic optical bistability due to the local field correction incorporated into the Maxwell Bloch formulation Advances in optical bistability in semiconductors relate closer to actual device applications *Optical Bistability*, 1980 **Optical Bistability III** Hyatt M. Gibbs, Paul Mandel, Nasser Peyghambarian, S. Desmond Smith, 2012-12-06 This is a collection of papers presented at the Topical Meeting on Optical Bistability OB3 held December 2 4 1985 in Tucson Arizona The increase in attendance to almost 200 shows that interest continues to grow in the subject of optical bistability OB and its wider implications both in application to optical digital computing and to basic physics notably instabilities and spatial effects The maturing of the field is evidenced by the fact that the number of experimental papers has caught up with the number of theoretical ones These trends were already apparent in OB2 and the 1984 Royal Society Meeting on Optical Bistability Dynamical Nonlinearity and Photonic Logic Progress in experimental topics included guided wave OB mostly thermal picosecond switching studies on quite a number of new materials optical computing and pattern recognition using arrays of nonlinear etalons Theoretical progress ranged from rather practical calculations on device performance noise effects on switching and transverse and longitudinal spatial effects to fundamental studies of dynamics instabilities and chaos The

Conference also included both theoretical ideas on optical computer architecture and intrinsic OB circuit elements such as full adder as well as the first demonstration of an intrinsic optical circuit in the form of a cascadable loop with buffered stores. A first demonstration of a simple pattern recognition algorithm using 2-D arrays of spots on a ZnSe interference filter was reported.

Physics of Nonlinear Optics Guangsheng He, Song H. Liu, 1999 Nonlinear optics has been a rapidly growing field in recent decades. It is based on the study of effects and phenomena related to the interaction of intense coherent light radiation with matter. *Physics of Nonlinear Optics* describes various major nonlinear optical effects including physical principles, experimental techniques, up-to-date research achievements, and current or potential applications. This book features clear conceptual descriptions, concise formulations, and emphasizes both theoretical and experimental aspects of nonlinear optics. The readability of this book is particularly enhanced by a series of color photographs showing the spectacular appearances of various nonlinear optical effects. Both authors of this book are outstanding research scientists renowned in their professional areas. Their major research achievements in nonlinear optics include the pioneering studies of two-wave coupled refractive index change, Raman-enhanced self-focusing, optical frequency Pockels effect, stimulated Kerr scattering, optical phase conjugation via backward stimulated emission, and two-photon absorption-based optical limiting, stabilization, and reshaping.

Optical Bistability: Controlling Light With Light Hyatt Gibbs, 2012-12-02 *Optical Bistability: Controlling Light with Light* focuses on optical bistability in nonlinear optical systems. Emphasis is on passive non-laser systems that exhibit reversible bistability with input intensity as the hysteresis variable, along with the physics and the potential applications of such systems for nonlinear optical signal processing. This book consists of seven chapters and begins with a historical overview of optical bistability in lasers and passive systems. The next chapter describes steady-state theories of optical bistability, including the Bonifacio-Lugiato model as well as the boundary conditions of an optical cavity and the coupled Maxwell-Bloch equations. Both intrinsic and hybrid experiments are then described, along with light-by-light control, pulse reshaping, and external switching. The transient phenomena that arise either from instabilities in the bistable systems themselves or from fluctuations in the number of nonlinear atoms or in the number of intracavity photons are also considered. The final chapter examines the characteristics and fundamental limitations of an ideal device, the prospect of improving devices by identifying giant nonlinearities, and the utilization of the full power of optics by parallel processing. This monograph is intended for new entrants and active workers in the field of optical bistability.

Physics of Semiconductor Devices K. N. Bhat, A. Dasgupta, 2004 Contributed papers of the workshop held at IIT Madras in 2003.

Optics of Semiconductors and Their Nanostructures Heinz Kalt, Michael Hetterich, 2013-04-09 In recent years, the field of semiconductor optics has been pushed to several extremes. The size of semiconductor structures has shrunk to dimensions of a few nanometers; the semiconductor light interaction is studied on timescales as fast as a few femtoseconds; and transport properties on a length scale far below the wavelength of light have been revealed. These advances were driven by rapid

improvements in both semiconductor and optical technologies and were further facilitated by progress in the theoretical description of optical excitations in semiconductors. This book, written by leading experts in the field, provides an up-to-date introduction to the optics of semiconductors and their nanostructures so as to help the reader understand these exciting new developments. It also discusses recently established applications such as blue light emitters as well as the quest for future applications in areas such as spintronics, quantum information processing, and third-generation solar cells.
