Agricultural Internet of Things Yong He, Pengcheng Nie, Qin Zhang, Fei Liu, 2021-08-02. Internet of things IoT is a new type of network that combines communication technology, expanded applications, and physical devices. Among them, agriculture is one of the most important areas in the application of the IoT technology, which has its unique requirements and integration features. Compared to the information technology in traditional agriculture, the agricultural IoT mainly refers to industrialized production and sustainable development under relatively controllable conditions. Agricultural IoT applies sensors, RFID, visual capture terminals, and other types of sensing devices to detect and collect site information and with broad applications in field planting, facility horticulture, livestock and poultry breeding, aquaculture, and agricultural product logistics. It utilizes multiple information transmission channels such as wireless sensor networks, telecommunications networks, and the internet to achieve reliable transmission of agricultural information at multiple scales and intelligently processes the acquired massive information. The goals are to achieve i) optimal control of agricultural production process, ii) intelligent electronic trading of agricultural products circulation, and iii) management of systematic logistics quality and safety traceability. This book focuses on three levels of agricultural IoT: network, information perception, technology, information transmission, technology, and application technology.

Coherent Lightwave Communications Technology S. Shimada, 2012-12-06. This book covers a wide range of technical issues relating to lightwave technologies using high coherence lightwaves. Electromagnetic wave communication started when the first wireless system was invented by Marconi in 1895. However, we had to wait about one hundred years to realize a similar technology in the lightwave frequency region. The invention of lasers in 1960 and two technology innovations in 1970, low loss silica fiber and semiconductor lasers operating at room temperature, promoted the development of fiber optic transmission systems. The deployment of high speed long haul fiber optic transmission systems has led to the formation of domestic and international trunk networks. The installed fiber cables in local loop plants provide multimedia communication services including broadband video. However, present lightwave communication systems do not fully utilize the fruitful potential of lightwaves, namely the capacity of extremely high frequency electromagnetic information carrier waves. The frequency of lightwaves used for fiber optic transmission is about 200 THz (2×10^{14} Hz) and the frequency bandwidth of the fiber low loss region is about 13 THz (1.3×10^{13} Hz). Recent developments of narrow spectrum width semiconductor laser and planar optical waveguide devices offer us the possibilities for a new generation of lightwave based communication systems. This book focuses on system aspects of the new generation lightwave communication technologies such as optical frequency division multiplexing and coherent detection. Chapter 1 overviews lightwave communication system technology.
