The New Handbook of Multisensory Processing Barry E. Stein, 2012-06-01 The major reference work for a rapidly advancing field synthesizes central themes reports on current findings and offers a blueprint for future research Scientists attempts to understand the physiology underlying our apprehension of the physical world was long dominated by a focus on the individual senses The 1980s saw the beginning of systematic efforts to examine interactions among different sensory modalities at the level of the single neuron And by the end of the 1990s a recognizable and multidisciplinary field of multisensory processes had emerged More recently studies involving both human and nonhuman subjects have focused on relationships among multisensory neuronal ensembles and their behavioral perceptual and cognitive correlates The New Handbook of Multisensory Processing synthesizes the central themes in this rapidly developing area reports on current findings and offers a blueprint for future research The contributions all of them written for this volume by leading experts reflect the evolution and current state of the field This handbook does more than simply review the field Each of the volume s eleven sections broadly surveys a major topic and each begins with a substantive and thought provoking commentary by the section editor that identifies the major issues being explored describes their treatment in the chapters that follow and sets these findings within the context of the existing body of knowledge Together the commentaries and chapters provide an invaluable guide to areas of general agreement unresolved issues and topics that remain to be explored in this fast moving field

The depth of unconscious processing as inferred from different suppression techniques. Julien Dubois, Nathan Faivre,2015-02-09

To what level are invisible stimuli processed by the brain in the absence of conscious awareness It is widely accepted that simple visual properties of invisible stimuli are processed however the existence of higher level unconscious processing e g involving semantic or executive functions remains a matter of debate Several methodological factors may underlie the discrepancies found in the literature such as different levels of conservativeness in the definition of unconscious or different dependent measures of unconscious processing In this research topic we are particularly interested in yet another factor inherent differences in the amount of information let through by different suppression techniques In the same conditions of well controlled conservatively established invisibility can we show that some of the techniques in the psychophysical magic arsenal e g masking but also visual crowding attentional blink etc reliably lead to higher level unconscious processing than others e g interocular suppression Some authors have started investigating this question using multiple techniques in similar settings We argue that this approach should be extended and refined Indeed in order to delineate the frontiers of the unconscious mind using a contrastive method one has to disentangle the limits attributable to unawareness itself and those attributable to the technique inducing unawareness The scope of this research topic is to provide a platform for scientists to contribute insights and further experiments addressing this fundamental question **The**
