Nanotoxicology and Nanosafety 2.0 Ying-Jan Wang, 2020-12-29 With the rapid development of nanotechnology nanomaterials have been widely applied in many industrial sectors including medicine consumer products and electronics While such technology has brought benefits and convenience to our daily lives it may also potentially threaten human health In some cases nanomaterials present unexpected risks to both humans and the environment Assessments of the potential hazards associated with nanotechnology have been emerging but substantial challenges remain because the large number of different nanomaterials cannot be effectively evaluated in a timely manner The development of a good strategy for a nanomaterials hazard assessment not only promotes the more widespread adoption of non rodent or 3Rs principles but also makes nanotoxicology testing more ethical relevant and cost and time efficient A thorough understanding of the mechanisms by which nanomaterials perturb biological systems is critical for a more comprehensive elucidation of their nanotoxicity and this will also facilitate the development of prevention and

intervention policies against adverse outcomes induced by them We hope that the articles included in this eBook can provide updated knowledge on nanotoxicology and nanosafety from the point of view of both toxicology and ecotoxicology

Mechanisms in Fibre Carcinogenesis Robert C. Brown, John A. Hoskins, Neil F. Johnson, 2012-12-06 The Editors are sorry that the production of this volume was delayed by the ill health of one of them and we hope that this does not detract from the value of the contents. For once this delay is not the fault of any of the authors; only the editors are to blame. Many of the workers in the field of fibre toxicology became convinced by the middle 1980s that the worst of the furore over asbestos was over, although we were left with an intriguing problem: how does asbestos cause disease? It was expected that the future impact of fibres on human health would be very small since asbestos exposure would be controlled and there was little chance that man-made fibres would prove hazardous. These man-made fibres are much thicker than asbestos and in most cases they are less durable in the body. Both of these properties are believed to make them much less likely to cause disease. However, many of us had fallen into the habit of calling these materials asbestos substitutes and thus they have acquired a little of the notoriety attached to the natural fibrous minerals. Very few of these man-made fibres are actually used as replacements for asbestos. Asbestos was not suitable for the uses to which the insulation wools are usually put and the ceramic fibres are replacements for fire brick, not asbestos, which is destroyed at the temperatures at which these materials are used.
