Green Budget Reform in Europe Kai

Schlegelmilch,2012-12-06 Budgets have a big influence on the economy and society With many countries about 50 percent of total expenditures and income pass through the budget via taxes charges and expenditures In recent years many countries e g in the OECD and the EU have tended to use this influence in an environmentally rational way Traditional environmental policy has relied on command and control and end of pipe technologies that have proven to be insufficient in coping with the challenge of global change Hence many countries have started to investigate the environmental impacts of their budgets by looking at existing taxes and charges as well as tax allowances and exemptions and other relevant regulations and expenditures even to have a special impact on the environment The implementation of those not meant such findings is now broadly discussed in these countries This publication will contribute to the debate It is a result of a wider project called Green Budget Reform Prospects in Central and Eastern Europe initiated by Vida Ogorelec Wagner managing Director of Umanotera The Slovenian Foundation for Sustainable Development and then jointly developed proposed to the EC and carried out in partnership with Kai Schlegelmilch of the Wuppertal Institute in Germany The project comprised an international seminar on Green Budget Reform in April 1997 at Lake Bled Slovenia and the Case Study of Sloveilla

The Impact of Overbuilding on People and the Planet David A. Ness,2019-02-01 This book challenges the status quo where profligate building and urban development is described as green and low carbon exposing a number of elephants in the big green room that severely impact upon society and the environment It questions the ethics equity and sustainability of continued growth of the building stock in industrialized contexts amid diminishing demand whilst the developing world is deprived of basic resources and infrastructure Even a circular built environment may not go far enough when dramatic reduction in consumption of resources is required to meet sufficient service levels More socio economic value may be derived from built resources by their stewardship adaptation reuse and equitable sharing while ameliorating the adverse impacts of overconsumption By taking a wider perspective of a sustainable built environment the text illustrated by case studies from the Olympics and nine countries reframes the policy debate and reforms current approaches through a new theory and manifesto It will appeal to policy makers architects urban designers educators students and green building practitioners

The Fight Over Food Wynne Wright,Gerard Middendorf,2010-11 One problem with the food system is that price is the bottom line rather than having the bottom line be land stewardship an appreciation for the environmental and social value of small scale family farms or for organically grown produce Interview with farmer in Skagit County Washington For much of the later twentieth century food has been abundant and convenient for most residents of advanced industrial societies The

luxury of taking the safety and dependability of food for granted pushed it to the back burner in the consciousness of many. Increasingly, however, this once taken for granted food system is coming under question on issues such as the humane treatment of animals, genetically engineered foods, and social and environmental justice. Many consumers are no longer content with buying into the mainstream commodity-driven food market on which they once depended. Resistance has emerged in diverse forms, from protests at the opening of McDonald's restaurants worldwide to ever greater interest in alternatives such as CSAs, community-supported agriculture, fair trade, and organic foods. The food system is increasingly becoming an arena of struggle that reflects larger changes in societal values and norms as expectations are moving beyond the desire for affordable, convenient foods to a need for healthy and environmentally sound alternatives. In this book, leading scholars and scholar-activists provide case studies that illuminate the complexities and contradictions that surround the emergence of a new day in agriculture. The essays found in *The Fight Over Food* analyze and evaluate both the theoretical and historical contexts of the agrifood system and the ways in which trends of individual action and collective activity have led to an accumulation of resistance that greatly affects the mainstream market of food production. The overarching theme that integrates the case studies is the idea of human agency and the ways in which people purposefully and creatively generate new forms of action or resistance to facilitate social changes within the structure of predominant cultural norms. Together, these studies examine whether these combined efforts will have the strength to create significant and enduring transformations in the food system.

Sustainable by Design Stuart Walker, 2012-05-04 To advance the subject of design, one has to engage in the activity of designing. *Sustainable by Design* offers a compelling and innovative design-centered approach that explores both the meaning and practice of sustainable design. Walker explores the design process in the context of sustainability and challenges conventional ways of defining designing and producing functional objects. He discusses the personal design process, tacit knowledge, ephemeral design, experimental design, and the relationship between intellectual design criteria, physical expression, and aesthetic experience. This book will introduce vital concepts to students and will inspire designers by providing a well-articulated basis for understanding the complexity and potential of sustainable design and extolling the contribution of design to the creation of a more meaningful material culture.

Environmental Science for Environmental Management Timothy O'Riordan, 2014-10-13 Environmental Science for Environmental Management has quickly established itself as the leading introduction to environmental science, demonstrating how a more environmental science can create an effective approach to environmental management on different spatial scales. Since publication of the first edition, environmentalism has become an increasing concern on the global political agenda. Following the Rio Conference and meetings on population, social justice, women, urban settlement, and oceans, civil society has increasingly promoted the cause of a more radical agenda, ranging from rights to know, fair trade, social empowerment, social justice, and civil rights for the oppressed, as well as novel forms of accounting and auditing. This new edition is set in the

context of a changing environmentalism and a challenged science It builds on the popularity and applicability of the first edition and has been fully revised and updated by the existing writing team from the internationally renowned School of Environmental Science at the University of East Anglia Environmental Science for Environmental Management is an essential text for for undergraduate students of environmental science environmental management planning and geography It is invaluable supplementary reading for environmental biology and environmental chemistry courses as well as for engineering economics and business studies

Introduction to Sustainability Nolberto Munier, 2006-01-05 Sustainability relates with Economics Society and Environment However one common fact that links them all is the generation of waste This chapter is divided into two The first part analyses the current generation of waste as well as its treatment The second intends to establish policies for the future treatment of waste or better yet for ceasing the generation of waste This first part begins by raising some capital questions What is waste Which are the components of waste Where is waste generated and How is waste treated The second part will deal with Why is waste produced and What is society doing to correct this problem 2 2 First part Current generation and treatment of waste 2 2 1 What is waste The dictionary defines waste as something useless unwanted or defective and the word by product as something produced in an industrial or biological process in addition to the principal product From the point of view of sustainability the word waste does not have that meaning as though it may be unwanted it is not something useless and is certainly not defective Even if in a manufacturing process a product or part of it does not conform to the manufacturer s quality specs it does not thereby become waste but is rather scrap material that is usually brought back to its original state and then processed again
