

## Posttraumatic Stress Disorder: Beyond DSM-IV

**D**SM-IV (1) is only a starting point for the diagnosis of posttraumatic stress disorder (PTSD). While the DSM-IV criteria for PTSD are useful in defining the disorder and distinguishing it from other diagnostic categories, there are important characteristics and subtypes commonly seen in clinical practice that affect its clinical course and response to treatment. In this issue of the *Journal*, Lanius and colleagues review the clinical and neurobiological evidence of a dissociative subtype of PTSD in order to increase its recognition, accurate assessment, and effective treatment (2).

Dissociation is described in DSM-IV as "a disruption in the usually integrated functions of consciousness, memory, identity, or perception of the environment" (p. 477). For PTSD, dissociative processes manifest as emotional numbing. For example, following an adult-onset trauma such as assault, the victim almost always recalls the events but is often numb to the feelings associated with the trauma—a presumably defensive dissociation between cognitive awareness and affect. When the dissociative barriers are breached, the victim is flooded with intrusive and intense recollections (e.g., flashbacks) of the trauma. In contrast to DSM-IV, the proposed DSM-V criteria (3) recognize this as a dissociative process (criterion B3). DSM-V also expands on dissociative symptoms (numbing, detachment, dissociative amnesia) that are prominent in acute stress disorder (4) and have long been associated with peritraumatic responses.

Lanius et al. describe a form of PTSD that is primarily characterized by symptoms of dissociation in the wake of prolonged traumatic experiences (e.g., chronic childhood trauma or combat experiences) that primarily manifest as chronic numbing. This is in contrast to prominent symptoms of intrusion and hyperarousal in response to acute trauma. The authors cite support for these observations in studies that use "trauma scripts" that trigger recall of the traumatic events. While many participants in these studies experienced reliving the events along with increased heart rates and other physiologic responses, others had dissociative responses and no increase in heart rate or other responses. Functional MRI studies have shown opposite responses in brain activity between these two groups in the medial prefrontal cortex, the anterior cingulate cortex, and the limbic system.

Lanius et al. postulate a subtype of PTSD characterized by overmodulation (i.e., excessive inhibition) of emotions when exposed to traumatic memories, and a subjective disengagement from the emotional content of the traumatic memory through depersonalization or derealization responses. Based on studies of brain activation in dissociative PTSD and borderline personality disorder, they hypothesize that a hyperinhibition of limbic regions by prefrontal areas occurs in situations of excessive emotional stimulation. In these patients, the relative detachment from the traumatic memories may be rooted in suppression of limbic regions with heightened frontal but diminished hippocampal activity—the hippocampus being an essential structure for the formation, storage, and retrieval of visual and verbal memory.

This corticolimbic inhibition model of a dissociative subtype of PTSD reflects many presentations commonly encountered in clinical settings. Lanius et al. cite a number of studies that suggest that the dissociative subtype is prominent among patients who have experienced chronic trauma such as prolonged childhood abuse or combat

*"In many ways, DSM-IV and the proposed DSM-V does not (and perhaps cannot) deal with complexity found in real clinical settings."*

**Posttraumatic Stress Disorder in Litigation** Robert I. Simon, 2008-08-13 The terrorist attacks on the World Trade Center in September 2001 turned PTSD into a household word But posttraumatic stress disorder has been documented throughout history For example as long ago as 1666 Samuel Pepys wrote in his diary that he still had night terrors 6 months after the great fire of London PTSD officially recognized as a diagnosis by DSM III in 1980 is only the most recent term used to describe the suffering of trauma victims Few could have foreseen its profound impact on litigation Often dubbed the black hole of litigation where allegations are relatively easy to assert but difficult to defend because the symptoms are subjective PTSD has deeply influenced civil and criminal law in cases ranging from malpractice and personal injury to sexual harassment and child abuse It is thus vital for all legal parties involved that forensic examiners perform credible psychiatric and psychological examinations of PTSD claimants Intended to add direction and discipline to the forensic assessment of PTSD litigants this expanded second edition begins with an updated chapter on current and future trends for the role of PTSD in litigation Chapter 2 notes the increasing evidence that exposure to multiple events not only is more common than previously thought but also increases the risk for development of PTSD following the target event Chapter 3 details diagnostic criteria and guidelines for the forensic psychiatric examination of the PTSD claimant Most literature discusses PTSD in adults Chapter 4 offers a rare perspective on PTSD in children and adolescents including parental response to the trauma developmental effects and delayed onset symptoms Forensic assessment of PTSD claimants is presented in Chapter 5 followed by new chapters on disability determinants how PTSD impairs occupational functioning and PTSD in the workplace where the causal relationship between employment stress and a resulting mental or emotional disorder must be determined Chapter 8 covers guidelines for malingering in PTSD where the claimant may be motivated by financial gain or by a reduced charge resulting from an insanity defense A new chapter on forensic laboratory testing in PTSD presents the tantalizing potential of psychophysiologic measurement to redeem the PTSD diagnosis from its daunting subjectivity This essential collection by 13 U S experts sheds important new light on forensic guidelines for effective assessment and diagnosis and

determination of disability serving both plaintiffs and defendants in litigation involving PTSD claims Mental health and legal professionals third party payers and interested laypersons will welcome this balanced approach to a complex and difficult field

**Posttraumatic Stress Disorder** Carol S. Fullerton, Robert J.
