Subbotin, Manuel Mundo-Ocampo, James G.

Baldwin, 2010-08-23 Volume 8 in the series appearing in two parts A and B deals with the systematics of cyst nematodes of the subfamily Heteroderinae. Cyst nematodes are important pathogens causing extensive damage and significant yield loss to many crops in both temperate and tropical regions. Part A presents summarised information on various aspects of morphology, biology, ecology, pathology, biogeography, control measures and diagnostics of these nematodes. Molecular diagnostic tables and comprehensive tabular and dichotomous keys for species identification together with descriptions of protocols for extraction, light and electron microscopy studies and molecular diagnostics are also included. The taxonomic section of part A provides diagnoses for six genera viz Globodera, Punctodera, Cactodera, Dolichodera, Betulodera and Paradolichodera and includes descriptions and morphometrics of 30 valid species. The work is illustrated by 101 drawings and photos. The genus Heterodera is mainly covered in part B, complete descriptions and morphometrics of the 80 known valid species being provided and the species illustrated by 159 line drawings and photos. Identification of the species using morphological and molecular techniques is also covered. Each part includes an extensive bibliography.

Cell Biology of Plant Nematode Parasitism R. Howard Berg, Chris Taylor, 2008-12-18 Plant parasitic nematodes are among the most destructive plant pathogens causing enormous losses to agronomic crops worldwide. This book provides an up to date review of research related to two of the most important nematode pests, root knot and cyst nematodes. Chapters cover early plant nematode interactions, identification of nematode proteins important in the establishment of nematode feeding sites and classification of biochemical and signaling pathways significant in the development of specialized feeding sites in the host. The cellular and subcellular structures essential for the parasitic interaction are examined by light and electron microscopy. Modern techniques of gene expression analyses and genomic sequencing are poised to provide an even greater wealth of information to researchers enabling them to develop and examine natural and manmade mechanisms of resistance to this important plant pest.

Plant Parasitic Nematodes in Subtropical and Tropical Agriculture, 3rd Edition Richard A. Sikora, Danny Coyne, Johannes Hallmann, Patricia Timper, 2018-08-10 Covering all aspects of practical plant nematology in subtropical and tropical agriculture, the third edition of this definitive global reference work is fully revised and in full colour throughout. It covers the presence, distribution, symptomology and management of all economically important plant parasitic nematodes damaging the world's major food and cash crops. This includes rice, cereals, solanum and sweet potatoes and other root and tuber crops, food legumes, vegetables, peanut, citrus, fruit tree crops, coconut and other palms, coffee, cocoa, tea, bananas, sugarcane, tobacco, pineapple, cotton, other tropical fibres, spices and medicinal plants. New content for this edition includes a chapter on nematode soil biodiversity and soil health, reflections on the future impact of nematodes and nematology on food security, the importance of climate change, emerging threats and new management technologies for large and small subsistence growers. Significant revisions to the IPM chapter and chapters on vegetables, citrus, legumes, tuber crops, cotton, peanut and banana where major advances in nematode management have occurred. This book is highly

Biotechnology and Plant Disease Management Zamir K. Punja,S. H. De Boer,Hélène Sanfaçon,2007-01-01 As agricultural production increases to meet the demands of a growing world population so has the pace of biotechnology research to combat plant disease Diseases can be caused by a variety of complex plant pathogens including fungi bacteria viruses and nematodes and their management requires the use of techniques in transgenic technology biochemistry and genetics While texts exist on specific pathogens or management practices a comprehensive review is needed of recent developments in modern techniques and the understanding of how pathogens cause disease This collection of studies discusses the key approaches to managing each group of pathogens within the context of recent developments in biotechnology Broad themes include microbe plant interactions molecular diagnostics of plant pathogens and enhancing the resistance of plants

Pine Wilt Disease: A Worldwide Threat to Forest Ecosystems Manuel M. Mota,Paulo R. Vieira,2008-08-28 Pine wilt disease PWD is unquestionably a major threat to forest ecosystems worldwide After seriously affecting Eastern Asian countries the challenge is now in Europe following its detection in Portugal in 1999 and its subsequent spread For foresters these were really very bad news and in order for adequate action to be taken scientists had to teach politicians about the seriousness of the problem That is never an easy task but it was successfully done at that time mainly by the continued effort of Professor Manuel Mota The challenge of having political decisions based on good science is fundamental for the success of any program but especially in difficult situations such as those arising by the introduction of harmful organisms in new ecosystems The success of the dialogue between science and policy requires intelligent partners from each side which is not always necessarily the case Examples of lack of recognition of problems raised by science are unfortunately abundant throughout the history of science The recent recognition of the efforts of the Intergovernmental Panel on Climate Change IPCC and Al Gore with the Nobel Prize and the continued failure in taking appropriate actions by major political players is a dramatic modern example of the difficulty of this dialogue
