Potential Function Methods for Approximately Solving Linear Programming Problems: Theory and Practice

Daniel Bienstock, 2013-03-26 Potential Function Methods For Approximately Solving Linear Programming Problems breaks new ground in linear programming theory. The book draws on the research developments in three broad areas: linear and integer programming, numerical analysis, and the computational architectures which enable speedy high level algorithm design. During the last ten years, a new body of research within the field of optimization research has emerged which seeks to develop good approximation algorithms for classes of linear programming problems. This work both has roots in fundamental areas of mathematical programming and is also framed in the context of the modern theory of algorithms. The result of this work in which Daniel Bienstock has been very much involved has been a family of algorithms with solid theoretical foundations and with growing experimental success. This book will examine these algorithms starting with some of the very earliest examples and through the latest theoretical and computational developments.

Integer Programming and Combinatorial Optimization

Friedrich Eisenbrand, Bruce Shepherd, 2010-06-09 The idea of a refereed conference for the mathematical programming community was proposed by Ravi Kannan and William Pulleyblank to the Mathematical Programming Society (MPS) in the late 1980s. Thus IPCO was born and MPS has sponsored the conference as one of its main events since IPCO I at the University of Waterloo in 1990. The conference has become the main forum for recent results in Integer Programming and Combinatorial Optimization in the non-Symposium years. This volume compiles the papers presented at IPCO XIV held June 9-11, 2010 at EPFL in Lausanne. The scope of papers considered for IPCO XIV is likely broader than at IPCO I. This is sometimes due to the wealth of new questions and directions brought from related areas. It can also be due to the successful application of math programming techniques to models not traditionally considered. In any case, the interest in IPCO is greater than ever and this is reflected in both the number (135) and quality of the submissions. The

Programme Committee with 13 members was also IPCO's largest. We thank the members of the committee as well as their sub-reviewers for their exceptional and time-consuming work and especially during the online committee meeting held over January. The process resulted in the selection of 34 excellent research papers which were presented in non-parallel sessions over three days in Lusanne. Unavoidably this has meant that many excellent submissions were not able to be included.

Combinatorics, Algorithms, Probabilistic and Experimental Methodologies Bo Chen, 2007-09-28 The First International Symposium on Combinatorics Algorithms Probabilistic and Experimental Methodologies was held in Hangzhou, China, in April 2007. The symposium provided an interdisciplinary forum for researchers to share their discoveries and approaches, search for ideas, methodologies and tool boxes, find better, faster and more accurate solutions and develop a research agenda of common interest. This volume constitutes the refereed post-proceedings of the symposium. Inside you will find 46 full papers. They represent some of the most important thinking and advancements in the field. The papers address large data processing problems using different methodologies from major disciplines such as computer science, combinatorics and statistics.

Equipment Selection for Mining: With Case Studies Christina N. Burt, Louis Caccetta, 2018-03-02 This unique book presents innovative and state-of-the-art computational models for determining the optimal truck loader selection and allocation strategy for use in large and complex mining operations. The authors provide comprehensive information on the methodology that has been developed over the past 50 years from the early ad hoc spreadsheet approaches to today's highly sophisticated and accurate mathematical-based computational models. The authors' approach is motivated and illustrated by real case studies provided by our industry collaborators. The book is intended for a broad audience ranging from mathematicians with an interest in industrial applications to mining engineers who wish to utilize the most accurate, efficient, versatile and robust computational models in order to refine their equipment selection and allocation strategy. As materials handling costs represent a significant component of total costs for mining operations, applying the optimization methodology developed here can substantially improve their competitiveness.
