Warren, 2008-04-15 Reviews focused topics both clinical and basic science in the fast moving area of IBD providing emphasis on the current challenges faced in the successful management of the disease Turn to

Plasticity of monocytes/macrophages: phenotypic changes during disease progression Ruoxi Yuan,Chao Yang,Yanan Ma,Liwu Li,2023-12-07 Macrophage is a key component of innate immunity that exhibit extensive plasticity and heterogeneity They are present in virtually every organ of the body and can be replenished by circulating monocytes following insults Originally macrophages were divided into two major phenotypes pro inflammatory M1 which is initiated by TNF INF and bacterial components such as lipopolysaccharide LPS and anti inflammatory M2 which is activated through stimulation of IL 4 IL 10 and IL 13 However segregation into two distinct phenotypes is a marked simplification of the in vivo reality and it is now widely accepted that macrophage phenotype is plastic and determined by highly complex microenvironments and therefore likely more accurately considered as a spectrum of possible forms of activation Numerous studies have documented flexibility in their programming with macrophages switching from one functional phenotype to another in response to the variable microenvironmental signals of the local milieu Various macrophage populations exist that play distinct and non redundant roles in fibrosis tissue repair and regeneration For instance in a general wound healing process embryo derived tissue resident macrophages are rapidly replaced by monocytes after the initial injury These monocyte derived macrophages play an active role in the early initiation of acute inflammation As early as 24 72 h upon tissue injury macrophage function changes toward an anti inflammatory phenotype that promotes cell proliferation and tissue remodeling Upon resolution of inflammation steady state self maintenance of macrophages is also recovered The wound microenvironment has a predominant role in the behavior and functionality of cells Both mouse and human diabetic wound preferably induce persistent proinflammatory macrophage polarization that contributes to chronic non healing wounds Contrastingly prolonged activation of M2 macrophages can also lead to excessive wound healing and ultimately fibrosis In the context of cancer anti inflammatory macrophages have been associated with tumor progression and immunosuppression thereby negatively affecting the prognosis of patients On the other hand studies also showed that the phenotypical changes of macrophages are also accompanied by changes in glycolysis and mitochondrial related genes as well Classically activated proinflammatory M1 macrophages depend to a large extent on glycolysis and produce lactate as the tricarboxylic acid cycle is blocked at two steps Alternatively activated M2 macrophages prefer oxidation and oxidative phosphorylation to synthesize ATP However the number and diversity of signals and the magnitude of the response required to switch macrophages into a pro or anti inflammatory state remain unclear A number of techniques have been developed over the years to identify and visualize cell populations uncover regulatory relationships between genes and track the

trajectories of distinct cell lineages in development The identification of mechanisms and molecules associated with macrophage plasticity and polarized activation provides a basis for macrophage centered diagnostic and therapeutic strategies Understanding and being able to controllably promote the desired macrophage phenotypes could have a significant impact on a wide range of diseases

Cross-Sectional Imaging in Crohn's Disease Jordi Rimola, 2019-01-25 This book comprehensively describes the state of the art in cross sectional imaging of Crohn's disease from both a clinical and a radiological perspective The uses and impact of the different imaging techniques in daily practice and research are thoroughly examined with coverage of ultrasound computed tomography and magnetic resonance In addition emerging trends are scrutinized The background to the book is an increasing perception that intestinal inflammation and complications are underdiagnosed using standard endoscopic or surgical techniques Patients with Crohn's disease usually require multiple reassessments during their lifetimes and often favor noninvasive techniques with a low risk of complications These factors have reinforced the need for effective cross sectional imaging techniques Additionally the expanding use of biologic agents combined with their increased efficacy

expense and risk justifies the use of these techniques particularly ultrasound and magnetic resonance to monitor disease treatment and objectively measure inflammation and healing Cross Sectional Imaging in Crohn s Disease will be of high value for both gastroenterologists and diagnostic radiologists Gastroenterology Abstracts and Citations ,1974 *Therapeutic Advances in Inflammatory Bowel Disease: Current Therapies and Future Directions* Giulia Roda,Marjorie Argollo,2023-10-23 Inflammatory bowel diseases IBD are chronic and progressive diseases Long term complications are demolition surgery and colon rectal cancer CRC A treat to target approach aims to modify the natural course of these diseases Targets are pre defined therapeutic goals demonstrated to prevent end organ disfunction and disability in the long term period According to the Selecting Therapeutic Targets in Inflammatory Bowel Disease STRIDE indications mucosal healing MH and clinical remission are the main targets in IBDs Recently the concept of remission and evidence on new targets included histological remission and transmural healing as future new targets It remains controversial whether achieving these targets is associated with significantly better long term disease outcomes In this Research Topic we aim to systematically review current evidence and future perspectives on therapeutic targets in IBD including mucosal and transmural healing

Nutrition and Tomorrow's Public Health: Challenges and Opportunities Irene Lenoir-Wijnkoop,Iñaki Gutiérrez-Ibarluzea,Dominique J. Dubois,2016-04-29 At the dawn of the third millennium we are confronted with a disturbing

phenomenon although global life expectancy still increases this is not the case for healthy life expectancy The explanation of this seemingly contradiction is mainly due to the rising prevalence of the new pandemic of chronic non communicable diseases NCDs Even in low and middle income countries the improvement in healthcare status and life expectancy is paralled by the increase of NCDs as in all countries worldwide Since the United Nations General Assembly held in New York in 2011 many publications have emphasized the close link between NCDs and nutrition The NCDs epidemic forces us to reconsider the public health perspectives Many governments non governmental organizations and other institutions are actively involved in educational nutrition programs and campaigns however their efforts seldom obtain the results hoped for It is extremely difficult to induce changes in lifestyle and behavior that have built up over a long period of time However it becomes urgent to adapt to our changing life environment where traditional wisdom and intuitive choices are giving way to individual thinking and search for often uncontrolled information This engenders a number of unprecedented challenges and it calls for a re appraisal of the existing paradigms to achieve an adequate management of the upstream determinants of health instead of a pre dominant medical and hospital centric approach In the era of personalized healthcare it is time to empower policy makers professionals and citizens for achieving an evidence based change in the health disease interface and decision making process for public health interventions The scientific and professional society Health Technology Assessment International HTAi has recognized nutrition as a health technology preventative by creating a Interest Group IG dedicated to research on methodologies and assessments of nutrition related public health while taking into account contextual factors ethical legal social organizational economic in order to generate meaningful outcomes for establishing evidence based health policies This Research Topic aims to elaborate on some of the potential hurdles or guarantees which have to be overcome for the sake of sustainable healthcare provisions anywhere in the world such as shortcomings in methodological approaches regulatory frameworks gaps between evidence its hierarchy and final recommendations for public health management

Endoscopy in Inflammatory Bowel Disease, An Issue of Gastrointestinal Endoscopy Clinics of North America Maria T. Abreu, 2016-09-16 The field of inflammatory bowel disease has evolved in many ways The first has been the revolution in medical therapy for the disease With the advent of biologic therapy the aspirational goal of therapy has become mucosal healing These medications have also made it possible to avoid or delay surgery for ulcerative colitis and Crohn s disease Although non invasive strategies such as MR or CT enterography or stool based assays are helpful they have not been able to replace the prognostic information provided by endoscopy Simultaneously the quality and spectrum of tools available to perform endoscopy has widened High resolution endoscopes are now the norm and are nearly as good as chromoendoscopy for identifying dysplasia in ulcerative colitis patients Most gastroenterologists also perform dilations but do not generally do this for patients with IBD Finally newer devices such as enteroscopes endoscopic ultrasound and endomicroscopes are being incorporated into the algorithms to diagnose and treat complications of IBD This issue highlights all of these advances by the experts in their fields
