first 20 years that followed the purinergic signalling hypothesis in 1972 most scientists were sceptical about its validity largely because ATP was so well established as an intracellular molecule involved in cell biochemistry and it seemed unlikely that such a ubiquitous molecule would act as an extracellular signalling molecule However after the receptors for ATP and adenosine were cloned and characterized in the early 1990s and ATP was established as a synaptic transmitter in the brain and sympathetic ganglia the tide turned More recently it has become clear that ATP is involved in long term trophic signalling in cell proliferation differentiation and death in development and regeneration as well as in short term signalling in neurotransmission and secretion Also important papers have been published showing the molecular structure of P2X receptors in primitive animals like Amoeba and Schistosoma as well as green algae This has led to the recognition of the widespread nature of the purinergic signalling system in most cell types and to a rapid expansion of the field including studies of the pathophysiology as well as physiology and exploration of the therapeutic potential of purinergic agents In two

books Geoffrey Burnstock and Alexej Verkhratsky have aimed at drawing together the massive and diverse body of literature on purinergic signalling The topic of this first book is purinergic signalling in the peripheral and central nervous systems and in the individual senses In a second book the authors focus on purinergic signalling in non excitable cells including those of the airways kidney pancreas endocrine glands and blood vessels Diseases related to these systems are also considered

Anatomy is the mother of physiology this statement was used to characterize the evolution of physiology from anatomy as an independent science in the late nineteenth century It had particular truth for neurophysiology which started as functional neuroanatomy based on the observation of changes in behaviour after lesions of the nervous system both in experimental animals and in human patients Today anatomy may again be considered the mother of physiology however the meaning of this statement is rather different from that 100 years ago The modern mother provides a dwelling for an increasing number of children endowed with new functional capabilities This book provides a good illustration of such semantic metamorphosis in the case of neuroanatomy After a long period of little progress in either macroscopic neuroanatomy or neurohistology during which the heritage of Cajal Golgi and others was developed and refined to yield a functional concept of the nervous system the past two decades have seen tremendous progress in methods applicable to the analysis of the nervous system

The new era was heralded by the introduction of the electron microscope to investigate the nervous system This book is an impressive witness to the more recent developments
