Ratio And Invention:

Paradigm Shift in Technologies and Innovation Systems John Cantwell, Takabumi Hayashi, 2019-11-02 This book provides some new ideas on the conceptualization of a shift in technological paradigm and it explores in depth the relevance of this concept for research on innovation systems. It examines text mining software and analyzes patent data as well as academic and business journals to illustrate the paradigm shift of newly emerging technologies such as the all solid state battery and automatic driving for electric vehicles and surgical robots. It also explores the critical role of emerging software technologies by examining US, EU and Japanese patent statistics. Highlighting the paradigm shift of technologies since the 1990s and the geographical dispersion of innovative capabilities, it identifies essential trends toward new innovation systems as well as the concentration and dispersion of national and corporate R D capabilities that have taken place as a result. In this new paradigm, the competitiveness of a company is decisively determined by other innovations in systems and management. Since the 1990s, when a network economy began to be established and technological know-how came to be easily transferred across borders, the changing structure of technological activities has required organizations with traditional integral and closed architecture models to move toward open innovation or modular architectures. These changes involve wider technological areas and cognitive diversity among international inter-firm and intra-firm R D networks. This book is highly recommended not only to academicians but also to business people seeking an in-depth and up-to-date overview of the paradigm shift of technologies and new innovation systems.

Dulling the Cutting Edge: How Patent-Related Policies and Practices Hamper Innovation in China Dan Prud'homme, 2012-08-22 This study's statistical analysis shows that patent quality and innovation in China deserve improvement and an in-depth legal management science and economic analysis in the study shows that various patent-related policies and practices actually hamper patent quality and innovation in China. Over 50 recommendations for reform are provided. The study is divided into four chapters, summaries of which are as follows. Although China became the world leader in quantity of domestically filed patent applications in 2011, the quality of these patents needs improvement. Also, while certain innovation in China is rising, the country's actual innovation appears overhyped by some sources. There appears to be an overly heavy focus on government-set quantitative patent targets in China, which can hamper patent quality and innovation. This overemphasis involves over 10 national-level and over 150 municipal/provincial quantitative patent targets, mostly to be met by 2015, which are also linked to performance evaluations for SoEs, Party officials and government ministries, universities and research institutes and other entities. China has a wide range of other policies, many of which are at least partially meant to encourage patents that can actually discourage quality patents and highest quality patents in particular and innovation. Examples of these policies include a variety of measures with requirements for indigenous intellectual property rights that are linked to financial incentives, many of which are unrelated to government procurement, a range of other government-provided financial incentives for patent development, e.g. certain patent filing

subsidies inappropriate inventor remuneration rules discriminatory standardization approaches and a wide range of others There are a host of concerns surrounding rules and procedures for patent application review and those for enforcement of patent disputes that can hamper building of quality patents and innovation in China These include concerns about abuse of patent rights difficulties invalidating utility models and a wide range of other issues **The Growth Report of**

Does female labor scarcity encourage innovation? Tan, Zhibo, Zhang, Xiaobo, 2016-07-01 Facing scarcity of a production factor a firm can develop technologies to either substitute the scarce factor price effect or complement the more abundant factors market size effect Whether the market size effect or the price effect dominates largely depends on the elasticity of substitution among factors according to the theory of directed technical change However it is a great challenge to empirically test the theory because factor prices are often endogenously

determined In this paper we use imbalanced sex ratios across Chinese provinces as a source of identification strategy to test how female labor scarcity affects corporate innovation based on the matched dataset of annual surveys of industrial firms in China and the national patent database In regions with a large male population female intensive industries face more serious problems finding female workers than their male intensive counterparts We find that such female shortages have spurred firms in female intensive industries to innovate more The pattern is much more evident in industries with low substitution between female and male workers than in those with high substitution consistent with the predictions of directed technical change theory
