Photorespiration"s Damaging Effects To Sports Turf Jeff Haag,2019-02-06 RuBP oxygenase carboxylase rubisco a key enzyme in photosynthesis is the molecular equivalent of a good friend with a bad habit In the process of carbon fixation rubisco incorporates carbon dioxide text CO₂ into an organic molecule during the first stage of the Calvin cycle Rubisco is so important to plants that it makes up 30 % or more of the soluble protein in a typical plant leaf 11 But rubisco also has a major flaw instead of always using text CO₂ as a substrate it sometimes picks up text O₂ instead This side reaction initiates a pathway called photorespiration which rather than fixing carbon actually leads to the loss of already fixed carbon as text CO₂ Photorespiration wastes energy and decreases sugar synthesis so when rubisco initiates this pathway it s committing a serious molecular faux pas Managing Reactive Oxygen Species In Sports Turf Jeff Haag,2019-02-07 Reactive oxygen species can have detrimental effects on sports turf This book describes the causes of reactive oxygen species its photosynthetic targets and nutrients and compounds that can manage and prevent them
