The Road to Sustainability Federico M. Pulselli, 2008 Is the concept of sustainability strongly founded on solid scientific bases And can this elusive concept be introduced in the economic framework and embodied in people's behavior as well as public and private institutions decision making This book presents a view of sustainability that starts from the acknowledgment of physical conditions and limits that humans can no longer neglect It also includes some epistemological foundations of the concept of sustainability and historical backgrounds The view is optimistic to the extent that economics the compass of our industrial society is open to inputs and suggestions coming from outside orthodox schemes Transdisciplinary science is one key element of such a change and this book is a transdisciplinary project In the field of the criticism to GDP as an omni comprehensive instrument the book also describes the methodology of the Index of Sustainable Economic Welfare ISEW proposed by H Daly and John Cobb in 1989 They proposed some revisions to the System of National Accounts and GDP in order to add information for policy makers towards sustainability Starting with consumption some adjustments are proposed to allow for inequality of income distribution environmental problems such as pollution costs long term environmental damage depletion of non renewable resources and social issues such as commuting costs urbanization costs public expenditure for health and education Computations for different nations have shown that ISEW increases together with increasing GDP up to a point beyond which it stagnates or even decreases due to the environmental and social pressure of economic growth The ISEW is a feasible calculation and some experiments at the local level in Italy are presented Advances in integrating different sustainability indicators both economic based and physical based are also presented as well as their use under a sustainability viewpoint
