Marine Propulsion System Diesel Amad Narto, Nasri, Suwondo, This book is intended as a learning supplement in the program of upgrading education and training for engine officer class III during the maintenance and repair of ship machinery and equipment course The scope of material in this book includes basic knowledge of drawing ship engine designs which contains the arrangement and capabilities of diesel engine the difference between 4 stroke and 2 stroke parts of diesel engine fuel combustion in the diesel engine cylinder compressed air system supercharging the combustion air volume and weight thrust block balancing vibration and noise ship speed propeller speed and slip crank shaft deflection Controllable Pitch Propeller CPP

Practicum Module Main Engine (DIESEL) Amad Narto, Eha Vembriarta, Diesel engine is an internal combustion aircraft an engine in which the fuel is ignited by high temperature gases which are compressed in the combustion chamber resulting in combustion in the combustion chamber Diesel engine are often used for main propulsion on a ship which has a large engine capacity and large power This is because diesel engines are suitable for long distance use or are more heat resistant than other types of engines The capacity of the diesel engine is very large and so does the power The construction of the diesel engine is also on average with a large capacity Diesel engines can be used with a variety of fuels both Marine

Diesel Oil MDO and Marine Fuel Oil MFO There are two classes of diesel engines namely 2 stroke and 4 stroke diesel engines Usually the number of cylinders is in multiples of two although any number of cylinders can be used during the cranking process that can be balanced to prevent excessive vibration Diesel engines work with fairly high compressed air so that larger diesel engines need to add more air Thus supercharge or turbocharge on the intake manifold is used to meet the needs of compressed air For a 2 stroke diesel engine an auxiliary blower is used since a 2 stroke diesel engine has a low speed 80 to 200 rpm while a 4 stroke engine does not require an auxiliary blower since the engine speed is already high 400 to 1500 rpm Operating large diesel engine requires support systems and auxiliary machineries for example cooling system lubrication system running air system fuel system exhaust system exhaust gas Meanwhile the auxiliary machineries include seawater pumps freshwater pumps lubrication pumps fuel pumps heaters compressors and air bottles auxiliary blowers turbo chargers and others Operations can use simulators as a real picture later but it can also use real labs such as engine halls and training ships as learning tools *Sustainable Energy Systems on Ships* Francesco Baldi,Andrea Coraddu,Maria E.

Mondejar,2022-07-21 Sustainable Energy Systems on Ships is a comprehensive technical reference for all aspects of energy efficient shipping The book discusses the technology options to make shipping energy consumption greener focusing on the smarter integration of energy streams the introduction of renewable resources and the improvement of control and operability Chapters not only describe each technology individually but also analyze their interconnections when implemented onboard and compare them in terms of suitability for different vessels and economic viability Readers of Sustainable Energy Systems on Ships will find an invaluable reference suitable for researchers professionals and managers involved in the shipping industry and those working on related energy efficiency technologies fuel cells and in the transport industry generally Students of maritime engineering will also be well served by this reference Clear analysis of the current implementation status of each technology discussed the barriers for further development and the potential for large scale implementation Enables decision making on the most suitable technologies for each type of vessel Integrates energy efficiency and emission control rules regulations technologies including data science and challenges in relation to the shipping industry Includes industry case studies on the integration of novel energy conversion technologies and renewable energy sources in operating ships Biomass Densification

Jaya Shankar Tumuluru,2021-01-26 This monograph discusses the various biomass feedstocks currently available for biofuels production and mechanical preprocessing technologies to reduce the feedstock variability for biofuels applications Variability in the properties of biomass in terms of moisture particle size distribution and low density results in storage transportation handling and feeding issues Currently biorefineries face serious particle bridging issues uneven discharge jamming of equipment and transportation problems These issues must be solved in order for smooth operations to be possible Mechanical preprocessing technologies such as size reduction densification and moisture management using drying and dewatering can help to overcome these issues Many densification

systems exist that will assist in converting low density biomass to a high density commodity type feedstock In 6 chapters the impact of densification process variables such as temperature pressure moisture etc on biomass particle agglomeration the quality of the densified products and the overall energy consumption of the process are discussed as are the various compression models for powders that can be used for biomass particles agglomeration behavior and optimization of the densification process using statistical and evolutionary methods The suitability of these densified products for biochemical and thermochemical conversion pathways is also discussed as well as the various international standards CEN and ISO they must adhere to The author has worked on biomass preprocessing at Idaho National Laboratory for the last ten years He is the principal investigator for the U S Department of Energy Bioenergy Technologies Office funded Biomass Size Reduction and Densification project He has developed preprocessing technologies to reduce cost and improve quality The author has published many papers and books focused on biomass preprocessing and pretreatments Biomass process engineers and biorefinery managers can benefit from this book Students in chemical mechanical biological and environmental engineering can also use the book to understand preprocessing technologies which greatly assist in improving the biomass critical material attributes The book can help policymakers and energy systems planners to understand the biomass properties limitations and technologies to overcome the same
