Revision of the Far East Asian Aphidiidae (Hymenoptera) P. Starý, E.I. Schlinger, 1967-06-30 **A Revision of the Far East Asian Aphidiidae (Hymenoptera)** Petr Starý, 2013-12-01 *The Braconid and Ichneumonid Parasitoid Wasps* Donald L. J. Quicke, 2014-12-01

The Ichneumonoidea is a vast and important superfamily of parasitic wasps with some 60 000 described species and estimated numbers far higher especially for small bodied tropical taxa. The superfamily comprises two cosmopolitan families Braconidae and Ichneumonidae that have largely attracted separate groups of researchers and this to a considerable extent has meant that understanding of their adaptive features has often been considered in isolation. This book considers both families highlighting similarities and differences in their adaptations. The classification of the whole of the Ichneumonoidea along with most other insect orders has been plagued by typology whereby undue importance has been attributed to particular characters in defining groups. Typology is a common disease of traditional taxonomy such that until recently quite a lot of taxa have been associated with the wrong higher clades. The sheer size of the group and until the last 30 or so years lack of accessible identification materials has been a further impediment to research on all but a handful of lab rat species usually cultured initially because of their potential in biological control. New evidence largely in the form of molecular data have shown that many morphological behavioural physiological and anatomical characters associated with basic life history features specifically whether wasps are ecto or endoparasitic or idiobiont or koinobiont can be grossly misleading in terms of the phylogeny they suggest. This book shows how with better supported phylogenetic hypotheses entomologists can understand far more about the ways natural selection is acting upon them. This new book also focuses on this superfamily with which the author has great familiarity and provides a detailed coverage of each subfamily emphasising anatomy taxonomy and systematics biology as well as pointing out the importance and research potential of each group. Fossil taxa are included and it also has sections on biogeography global species richness culturing and rearing and preparing specimens for taxonomic study. The book highlights areas where research might be particularly rewarding and suggests systems groups that need investigation. The author provides a large compendium of references to original research on each group. This book is an essential workmate for all postgraduates and researchers working on ichneumonoid or other parasitic wasps worldwide. It will stand as a reference book for a good number of years and while rapid advances in various fields such as genomics and host physiological interactions will lead to new information as an overall synthesis of the current state it will stay relevant for a long time.

A Revision of the Far East Asian Aphidiidae (Hymenoptera) Petr Starý, 1967-01-01 *Entomology Ecology & Biodiversity* B.K. Tyagi, V. Veer, 2011-04-01

The dominance of insects amongst all living organisms on earth coupled with infinite wealth of knowledge so important for our own existence is a fundamental scientific fact which is yet to be widely acknowledged. This dominance means that in numbers of species beyond our comprehension these animals permeate diverse and essential natural processes in Earth's terrestrial aerial and freshwater ecosystems contributing to the function of the

natural world as a self sustaining biological system Invariably insects are an integral and complex part of the terrestrial and freshwater ecosystems with which the future of humans is inextricably linked Insects have ultimately achieved a formidable diversity Generally insects are beneficial organisms however many of them are important pests and or vectors to a large number of parasites and other microbial pathogens to both human being his associates and the plants The burden caused by their infestation or infection run up to several million zillion rupees annually Therefore knowledge about extreme biodiversity and ecological relationships of these animals is a practical necessity in the man s own interest to sustain the species Packed with original 25 original articles reviews this book on Entomology Ecology and Biodiversity offers an invaluable opportunity to comprehend more deeply about our most intimate allies the insects The book truly establishes a foundation in basic entomology through varied and diverse treatment to entomology while focusing on specialized topics in insect ecology and biodiversity forensic and medical entomology

Proceedings of the 9th International Symposium on Insect-Plant Relationships Erich Städler, Martine Rowell-Rahier, Robert Baur, 2012-12-06 The 9th International Symposium on Insect Plant Relationships SIP 9 was once more following the tradition established in 1958 a forum for investigators in both basic and applied entomology interested in the important and fascinating field of interactions between plants and insects We were pleased and honoured to organise this symposium which took place June 24 30 1995 in Gwatt on the shores of the Lake of Thun in Switzerland 168 participants from 26 countries from all over the world actively took part in the symposium by contributing 12 key note lectures and a total of 141 oral presentations and posters The favourable response and the lively interaction of the participants in all symposium activities is the clearest indication of the success of SIP 9 The organisers appreciated the enthusiasm and the willingness to collaborate shown by all participants The following volume contains written contributions 72 of only half of all presentations This is due to the fact that we decided to produce not only an account of the proceedings but also to publish all contributions as a special volume of the journal *Entomologia*

Experimentalis et Applicata This procedure was last adopted in 1978 for SIP 4 organised by Reginald F Chapman and Elizabeth A Bernays and ensures a wide distribution of the papers within the scientific community and easy access through libraries Inevitably we had to employ the same review procedure as applicable for the manuscripts regularly submitted to *Entomologia*

Carabid Beetles: Ecology and Evolution K. Desender, M. Dufrêne, M. Loreau, M.L. Luff, J-P. Maelfait, 2013-04-17 The Carabidae form one of the largest and best studied families of insects occurring in nearly every terrestrial habitat The contributions included in this book cover a broad spectrum of recent research into this beetle family with an emphasis on various aspects of ecology and evolution They deal both with individual carabid species for example in studies on population and reproductive biology or life history in general and with ground beetle communities as exemplified in papers treating assemblages in natural habitats on agricultural land and in forests Disciplines range from biogeography and faunistics over morphology taxonomy and phylogenetics ecophysiology and functional ecology to population community

conservation and landscape ecology This volume is the result of the 8th European Carabidologists Meeting 2nd International Symposium of Carabidology September 1-4 1992 Belgium

Proceedings of the 10th International Symposium on Insect-Plant Relationships Stephen J. Simpson, A. Jennifer Mordue, Jim Hardie, 2013-04-17 Over the past 40 years the SIP meetings have played a central role in the development of the field of insect plant relationships providing both a show case for current research as well as a forum for the airing and development of influential new ideas The 10th symposium held 4-10 July 1998 in Oxford followed that tradition The present volume includes a representative selection of fully refereed papers from the meeting plus a listing of the titles of all presentations The volume includes reviews of major areas within the subject along with detailed experimental studies Topics covered include central neural and chemosensory bases of host plant recognition integrative studies of insect behaviour tritrophic interactions plant defences insect life histories plant growth responses microbial partners in insect plant associations and genetic bases of host plant associations The book provides a key source for students and research workers in the field of insect plant relationships

Proceedings of the 11th International Symposium on Insect-Plant Relationships Jens Kvist Nielsen, Christian Kjær, Louis M. Schoonhoven, 2013-06-29 The 11th International Symposium on Insect Plant Relationships SIP11 held on August 4-10 2001 in Helsingør Denmark followed the tradition of previous SIP meetings and covered topics of different levels from chemistry physiology and ethology to ecology genetics and evolution of insect plant relationships The present volume includes a representative selection of fully refereed papers as well as a complete list of all the contributions which were presented at the meeting Reviews of selected topics as well as original experimental data are included The book provides valuable information for students and research workers interested in chemical and biological aspects of interactions between individuals and populations of different organisms

Insect life-cycle polymorphism H.V. Danks, 2013-04-17 Recent studies have shown that genetic polymorphisms play an important role in structuring the seasonal life cycles of insects complementing an earlier emphasis on the effects of environmental factors This book presents current ideas and recent research on insect life cycle polymorphism in a series of carefully prepared chapters by international experts covering the full breadth of the subject in order to give an up to date view of how life cycles are controlled and how they evolve By consolidating our view of insect life cycle polymorphism in this way the book provides a staging point for further enquiries The volume will be of interest to a wide variety of entomologists and other biologists interested in the control and evolution of life cycles and in understanding the extraordinarily complex ecological strategies of insects and other organisms

Parasitoid Wasps of South East Asia Buntika A. Butcher, Donald L. J. Quicke, 2023-12-22 Parasitoid wasps are cosmopolitan numerous and enormously diverse with probably one million or more species worldwide most of which occur in the moist tropics Their ecological importance is enormous although perhaps most evident in their major roles in the control of insect pest populations In natural ecosystems they are integral in regulating populations of a vast number of insects and

therefore are key players in terrestrial food webs Knowledge of their biology is still very poor because the current state of taxonomy is still in its infancy in most parts of the world In this book we provide an overview of the more than 30 families of parasitoid wasps that occur in the 11 countries in South East Asia Particular emphasis is given to those most commonly encountered and reared as well as to those used in biological control programmes Outlines of the morphology biology ecology and behaviour of each family as well as of various important subfamilies are presented The current state of taxonomy in the region is summarised Other chapters cover basic biology behaviour morphological terminology phylogeny and methods of specimen collecting preparation and rearing with particular relevance to the tropics Modern molecular approaches to speeding taxonomic description of hyperdiverse taxa are considered in depth All groups are illustrated with colour photographs This book will be of value to professional entomologists academics entomology students and the growing body of amateur entomologists and insect photographers

Aphid Parasites (Hymenoptera, Aphididae) of the Central Asian Area
Petr Strydom, 1979-08-31 An analysis of the particular topics in biological control programmes all over the world indicates an increased interest in the utilization of aphid parasites Besides the so called traditional biological control of introduced aphids there appears a situation which could perhaps be called a renaissance of biocontrol i e the utilization of biotic agents against insecticide resistant populations of aphid pests The rapid increase in the amount of information as well as the necessity of synthetic papers are the well known features in today's entomology This requirement is much more topical in the groups where brief summarized information is needed for research workers in applied branches The author has been well aware of all these difficulties and requirements owing to his own experience both in basic and applied research Several years ago he decided to summarize our knowledge on the aphid parasites of the world by elaborating synthetic studies on the particular zoogeographical areas These papers have been intended to represent annotated reviews of the parasite fauna distribution biology and utilization in aphid pest management with keys to genera and species hosts parasite catalogue and a list of references added Naturally these studies are only relatively updated with respect to a certain deadline from which the research may be further continued At present the Far East Asian and the Mediterranean areas have been reviewed in this or at least in a similar manner

century and especially ever since the advent of the Green Revolution modern agriculture has been striving to feed and clothe the ever increasing multitudes of the human species through improved technology relying heavily on tremendous inputs of fertilisers pesticides and various other agrochemicals Undoubtedly this has been a great blessing to mankind and enormous strides have indeed been made in the never ending struggle against starvation but these have been achieved at a very steep price of increased environmental deterioration In fact modern agriculture has become one of the major factors contributing to the degradation of the world's fragile biosphere Insecta Koreana ,1999 *Aphid Parasitoids of India and Adjacent Countries (Hymenoptera: Aphidiidae)* Petr Starý, Asish Kumar Ghosh, 1983 *Micronesica* ,2000 *Acta Entomol.
