Searching The Depths:

Man vs. Machine Karsten Müller, Jonathan Schaeffer, 2018-10-30 Man vs Machine Technology continues to advance at a rapid pace It may sound quaint today but not so long ago computers battled humans for supremacy at the game of chess The challenge of building a computer program capable of defeating the best of human kind at chess was one of the original grand challenges of the fledgling field of artificial intelligence On one side were dedicated scientists and hobbyists who invested decades of effort developing the software and hardware technology on the other side were incredibly talented humans with only their determination and preparation to withstand the onslaught of technology The man versus machine battle in chess is a landmark in the history of technology There are numerous books that document the technical aspects of this epic story The human side is not often told Few chess players are inclined to write about their man machine encounters other than annotating the games played This book brings the two sides together It tells the stories of many of the key scientists and chess players that participated in a 50 year research project to advance the understanding of computing technology Grandmaster Karsten Müller and Professor Jonathan Schaeffer have managed to describe the fascinating history of the unequal fight of man against machine in an entertaining and instructive way It evoked pleasant and not so pleasant memories of my own fights against the monsters I hope that their work gives you as much pleasure as it has given me From the Foreword by Vladimir Kramnik 14th World Chess Champion

Search in Artificial Intelligence Leveen Kanal,Vipin Kumar,2012-12-06 Search is an important component of problem solving in artificial intelligence AI and more generally in computer science engineering and operations research Combinatorial optimization decision analysis game playing learning planning pattern recognition robotics and theorem proving are some of the areas in which search algorithms play a key role Less than a decade ago the conventional wisdom in artificial intelligence was that the best search algorithms had already been invented and the likelihood of finding new results in this area was very small Since then many new insights and results have been obtained For example new algorithms for state space AND OR graph and game tree search were discovered Articles on new theoretical developments and experimental results on backtracking heuristic search and constraint propagation were published The relationships among various search and combinatorial algorithms in AI Operations Research and other fields were clarified This volume brings together some of this recent work in a manner designed to be accessible to students and professionals interested in these new insights and developments *Computers and Games* H. Mathematical Aspects of Artificial Intelligence Frederick Hoffman, American Mathematical Society, There exists a history of great expectations and large investments involving artificial intelligence AI There are also notable shortfalls and memorable disappointments One major controversy regarding AI is just how mathematical a field it is or should be This text includes contributions that examine the connections between AI and mathematics demonstrating the potential for mathematical applications and exposing some of the more mathematical areas within AI The goal is to stimulate interest in people who can contribute to the field or use its results Included in the work by M Newborn on the famous Deep Blue chess match He discusses highly mathematical techniques involving graph theory combinatorics and probability and statistics G Shafer offers his development of probability through probability trees with some of the results appearing here for the first time M Golumbic treats temporal reasoning with ties to the famous Frame Problem His contribution involves logic combinatorics and graph theory and leads to two chapters with logical themes H Kirchner explains how ordering techniques in automated reasoning systems make deduction more efficient Constraint logic programming is discussed by C Lassez who shows its intimate ties to linear programming with crucial theorems going back to Fourier V Nalwa's work provides a brief tour of computer vision tying it to mathematics from combinatorics probability and geometry to partial differential equations All authors are gifted expositors and are current contributors to the field The wide scope of the volume includes research problems research tools and good motivational material for teaching
