Metacognition and Cognitive Neuropsychology Giuliana Mazzoni, Thomas O. Nelson, 2014-05-12 Control processes are those mental functions that allow us to initiate monitor and prioritize mental activities They are crucial to normal mental functioning A better understanding of the nature of control processes and their

deficits is important for clinical work and for an adequate theory of consciousness. Previously control processes have been examined within the frameworks of two parallel but independent paradigms: those of cognitive psychology and of neuropsychology. Cognitive psychologists have stressed the theoretical and empirical nature of normal unimpaired control processes; neuropsychologists have focused on the relationships between damage to specific functional areas of the brain and deficits in specific control processes. Both have contributed extensively to our understanding of control processes. However, they have tended to operate independently with little if any cross talk between disciplines despite the potential benefits such dialogue is likely to generate. This book represents the first attempt to synthesize cognitive and neuropsychological perspectives on control processes. It contains state-of-the-art reports on various aspects of control processes by experts from both disciplines.

Native Listening Anne Cutler, 2015-01-30. An argument that the way we listen to speech is shaped by our experience with our native language. Understanding speech in our native tongue seems natural and effortless; listening to speech in a nonnative language is a different experience. In this book, Anne Cutler argues that listening to speech is a process of native listening because so much of it is exquisitely tailored to the requirements of the native language. Her cross-linguistic study, drawing on experimental work in languages that range from English and Dutch to Chinese and Japanese, documents what is universal and what is language-specific in the way we listen to spoken language. Cutler describes the formidable range of mental tasks we carry out all at once with astonishing speed and accuracy when we listen. These include evaluating probabilities arising from the structure of the native vocabulary, tracking information to locate the boundaries between words, paying attention to the way the words are pronounced, and assessing not only the sounds of speech but prosodic information that spans sequences of sounds. She describes infant speech perception, the consequences of language-specific specialization for listening to other languages, the flexibility and adaptability of listening to our native languages, and how language specificity and universality fit together in our language processing system. Drawing on her four decades of work as a psycholinguist, Cutler documents the recent growth in our knowledge about how spoken word recognition works and the role of language structure in this process. Her book is a significant contribution to a vibrant and rapidly developing field.
