Moore, 2006-04-11 This volume contains proceedings of the NATO Russia Advanced Research Workshop on Nanostructured Thin Films and Nanodispersion Strengthened Coatings December 2003 Moscow During this Workshop leading researchers from twelve countries had presented and discussed most recent developments in the fields of plasma physics and surface engineering related to the preparation and applications of nanostructured thin films and nanodispersion strengthened coatings These presentations are encompassed in 31 individual chapters The chapters are assembled in five parts in according to the workshop sessions Part I is a compilation of chapters on hard and tribological coatings The recent advances in this area are significant in that it is now possible to engineer strong hard and tough coatings that can operate at temperatures higher than 1200 C and exhibit smart adaptive characteristics These coatings are based on an amorphous matrix e g nitrides carbides borides or carbon in which there is a controlled nucleation and growth of ultra hard nanoparticles of crystalline carbides nitrides borides and oxides The critical feature is the control of both the particle size i e less than 10 nm and interpartical spacing of a few nanometers The smart or adaptive characteristic is engineered into the nanostructures using similar sized less than 10 nm particles of metallic chalcogenides ductile metals or glass forming elements to provide high lubricity and chemical adaptation at the environment change e g high and low humidities and temperatures

The Coming of Materials Science R.W. Cahn, 2001-03-16 The Coming of Materials Science both covers the discipline of materials science and draws an impressionistic map of the present state of the subject The first chapter examines the emergence of the materials science concept in both academe and industry The second and third chapters delve back into the prehistory of materials science examining the growth of such concepts as atoms crystals and thermodynamics and also examine the evolution of a number of neighbouring disciplines to see what helpful parallels might emerge The book contains numerous literature references Many refer to the earliest key papers and books while others are to sources often books offering a view of the present state of a topic Early references are to the past but as the book continues it brings the reader up to date with more recent sources The

author Professor Robert Cahn FRS has striven to be critical about the history of the discipline of materials science and to draw general conclusions about scientific practice from what he has discovered about the evolution of materials science. Further issues that the book highlights include What is a scientific discipline? How do disciplines merge and differentiate? Can a discipline also be interdisciplinary? Is materials science a real discipline? A large range of themes is presented in the book and readers are invited to interact with the author if they reach alternative conclusions. This book is not just for reading and reference but exists to stimulate thought and provoke discussion as well.

Advanced Light Alloys and Composites R. Ciach, 2013-06-29. An expert exposition of the structural and mechanical properties of light alloys and composites bridging the gap between scientists and industrial engineers in its consideration of advanced light materials: their structure, properties, technology and application. Includes basic problems of alloy constitution and phase transformations. The aluminium alloys are the main topic of the book, consideration being given to their properties, casting technology, thermomechanical treatment and structure. Attention is also given to the magnesium alloys, particularly those having rare earth metal constituents. Both commercial titanium alloys and intermetallic compounds are discussed, as are metallic composites. The latest engineering techniques are discussed in both theoretical and practical terms.

Multiscale Materials Modelling Z. X. Guo, 2007-05-31. Multiscale materials modelling offers an integrated approach to modelling material behaviour across a range of scales from the electronic, atomic and microstructural up to the component level. As a result, it provides valuable new insights into complex structures and their properties, opening the way to develop new multi-functional materials together with improved process and product designs. Multiscale materials modelling summarises some of the key techniques and their applications. The various chapters cover the spectrum of scales in modelling methodologies, including electronic structure calculations, mesoscale and continuum modelling. The book covers such themes as dislocation behaviour and plasticity, as well as the modelling of structural materials such as metals, polymers and ceramics. With its distinguished editor and international team of contributors, Multiscale materials modelling is a valuable reference for both the modelling community and those in industry wanting to know more about how multiscale materials modelling can help optimise product and process design. Reviews the principles and applications of multi-scale materials modelling. Covers themes such as dislocation behaviour and plasticity and the modelling of structural materials. Examines the spectrum of scales in modelling methodologies, including electronic structure calculations, mesoscale and continuum modelling.
