innovative developments in the most diverse fields of technology and areas of application in society and the marketplace. The technology it is believed has the potential for far-reaching changes that will eventually affect all areas of life. Such changes will doubtlessly have strong repercussions for society and the environment and bring with them not only the desired and intended effects such as innovations in the form of improvements to products, processes and materials, economic growth, new jobs for skilled workers, relief for the environment and further steps toward sustainable business, but also unexpected and undesirable side effects and consequences. With respect to the time spans in which nanotechnology's full potential will presumably unfold, M. C. Roco (2002, 5) identified the following stages or generations for industrial prototypes and their commercial exploitation. Past and present: The coincidental use of nanotechnology. Carbon black, for example, has been in use for centuries; more specific, isolated applications (catalysts, composites, etc.) have been in use since the early nineties. First generation: Passive nanostructures (ca. 2001). Application particularly in the areas of coatings, nanoparticles, bulk materials, nanostructured metals, polymers and ceramics. Second generation: Active nanostructures (ca. 2005). Fields of application particularly in transistors, reinforcing agents, adaptive structures, etc. **World Energy Supply** Manfred Grathwohl, 2018-12-03.
