Recombinant Dna Vaccines Rationale And Strategy:

Recombinant DNA Vaccines Richard Isaacson,1992-07-21 Vaccine Design Michael F. Powell,Mark J.

Newman,2012-12-06 When my interest was first drawn to the phenomenon of vaccination for virus diseases in the late 1930s the state of the art and the science of vaccine design was not far advanced beyond the time of Jenner at the end of the 18th century and of Pasteur a century later In the 1930s it was still believed that for the induction of immunity to a virus caused disease the experience of infection was required but not for a toxin caused disease such as diphtheria or tetanus for which a chemically detoxified antigen was effective for immunization This prompted the question as to whether it might be possible to produce a similar effect for virus diseases using nonreplicating antigens When in the 1930s and 1940s it was found possible to propagate influenza viruses in the chick embryo protective effects could be induced without the need to experience infection by the use of a sufficient dose of a noninfectious influenza virus preparation Later in the 1940s it became possible to propagate polio and other viruses in cultures of human and monkey tissue and to immunize against other virus diseases in the same way Later with the advent of the era of molecular biology and genetic engineering antigens and vaccines could be produced in new and creative ways using either replicating or nonreplicating forms of the appropriate antigens for inducing a dose related protective state Vaccine Analysis: Strategies, Principles, and Control Brian K.

Nunnally,Vincent E. Turula,Robert D. Sitrin,2014-11-27 This book is an indispensable tool for anyone involved in the research development or manufacture of new or existing vaccines It describes a wide array of analytical and quality control technologies for the diverse vaccine modalities Topics covered include the application of both classical and modern bio analytical tools procedures to assure safety and control of cross contamination consistent biological transition of vaccines from the research laboratory to manufacturing scale whole infectious attenuated organisms such as live attenuated and inactivated whole cell bacterial vaccines and antiviral vaccines using attenuated or inactivated viruses principles of viral inactivation and the application of these principles to vaccine development recombinant DNA approaches to produce modern prophylactic vaccines bacterial subunit polysaccharide and glycoconjugate vaccines combination vaccines that contain multiple antigens as well as regulatory requirements and the hurdles of licensure **Current Pharmaceutical Design**

and Production of Vaccines Sara Cohen,Avigdor Shafferman,2013-06-29 Vaccination is one of the most efficient and cost effective methods of promoting human health and has been in clinical use for at least 200 years Nevertheless infectious diseases continue to constitute a constant threat to the well being of humanity Common pathogens once believed to be under control acquire increased virulence and resistance to drugs while exotic microorganisms emerged from hidden reservoirs to cause yet incurable diseases in humans These changes together with epidemic outbreaks related to political and socio

economic instabilities increase the needs for the development of new advanced vaccines In this volume devoted to the proceedings of the 39th OHOLO Conference we present some of the recent strategies for the design and production of novel vaccines The advent of recombinant DNA technology has stimulated the production of several subunit vaccines In spite of the obvious advantages to this approach the limited immunogenicity of many subunit candidates has hindered their development Strategies to enhance the immunogenicity of subunit vaccines is therefore critical Several approaches toward this goal including design of novel adjuvants and delivery systems as well as design of advantageous carriers are presented here Among the carriers evaluated here are polypeptides flagellin HBV core antigen J3 galactosidase attenuated virions Vaccinia Sindbis and nonpathogenic licensed bacteria Salmonella
