Short Wave Length Coherent Radiation:

Short Wavelength Coherent Radiation David T. Attwood, 1986 *Short Wavelength Laboratory Sources* Davide Bleiner, John Costello, Francois de Dorton, Gerry O'Sullivan, Ladislav Pina, Alan Michette, 2014-12-04 Our ability to manipulate short wavelength radiation 0.01-100nm equivalent to 120keV-12eV has increased significantly over the last three decades. This has led to major advances in applications in a wide range of disciplines such as the life and medical sciences including cancer related studies, environmental science including studies of pollution and its effects, archaeology and other cultural heritage disciplines and materials science. Although expansion in application areas is due largely to modern synchrotron sources, many applications will not become widespread and therefore routinely available as analytical tools if they are confined to synchrotrons. There is a need to develop bright but small and low cost X-ray sources not to replace synchrotrons but to complement them and this book will look at how to facilitate these developments. Written by a distinguished team of international authors, this book is based on the COST Action MP0601 Short Wavelength Laboratory Sources. The contents are divided into five main sections: the introductory section provides a comprehensive introduction to the fundamentals of radiation generation mechanisms and short wavelength laboratory sources; the middle sections focus on modelling and simulation, source development, improvement and characterisation and integrated systems; sources, optics and detectors; the final section looks at recent applications. Aimed at academic and industrial researchers in physical chemistry and chemical physics, the contents provide practical information about the implementation of short wavelength laboratory sources and their applications. Topical Meeting on Optical Bistability (OB3), 1988 Applications of High-Field and Short Wavelength Sources Louis DiMauro, Margret Murnane, Anne L'Huillier, 2013-06-29 The Optical Society of America Conference on Applications of High Fields and Short Wavelength Sources held in Santa Fe, New Mexico, USA from March 20-22, 1997 was an exceptionally exciting conference. This conference was the seventh in a series of topical conferences held every two years which are devoted to the generation and application of high field and short wavelength sources. The meeting was truly international in scope with equal participation from both within and outside of the US. In the past two years there has been dramatic progress in both laser and x-ray coherent sources, both fundamental and applied. The 1997 meeting highlighted these advances which are summarized in sections 1 and 2 of this volume. Terawatt class lasers are now available in the UV or at high repetition rates. Michael Perry, LLNL presented a keynote talk on petawatt class lasers and their applications in inertial confinement fusion while Jorge Rocca, Colorado State University presented a keynote talk on tabletop soft x-ray lasers. Generation and measurement techniques are becoming very sophisticated throughout the UV and x-ray region of the spectrum and coherent sources have been extended to wavelengths below 30Å. Phase control in the x-ray region is also now possible and new phase matching schemes in the UV have been experimentally demonstrated. It is clear that a new field of x-ray nonlinear optics will develop rapidly over the next few years. **Energy Research Abstracts**, 1992-04 **Modern**

Challenges in Quantum Optics Miguel Orszag, Juan C. Retamal, 2008-01-11 Quantum Optics is a rapidly progressing field well suited to probe the many fundamental issues raised by the subtleties of quantum physics This book consists of a collection of reviews and papers that highlight the most important challenges faced in this area of research including topics such as cavity QED quantum entanglement decoherence matter waves and nonlinear optics It will be a source of reference for all those who wish to familiarize themselves with the latest developments in the field Vacuum Ultraviolet Photoionization And Photodissociation Of Molecules And Clusters Cheuk-yiu Ng, 1991-06-25 This monograph reviews the recent progress in vacuum ultraviolet VUV photoionization and photodissociation processes Photoionization photoelectron and fluorescence spectroscopic techniques have played an important role in revealing the photoionization and photodissociation dynamics of molecules in the vacuum ultraviolet region and in providing accurate energetic and spectroscopic information of ions as well as neutral molecules The book represents the first detailed review of major experimental developments in the studies of single vacuum ultraviolet photon ionization and dissociation processes of gaseous molecules and clusters **Short wavelength coherent radiation, generation and applications. Proceedings of the Topical Meeting ; 1**, 1982 **Time-resolved Diffraction** J. R Helliwell, P. M. Rentzepis, 1997-12-18 The acceleration of the technical capabilities of X ray electron and neutron diffraction techniques in recent years has been driven by developments in synchrotron and neutron sources detectors and computers These allow the rapid and repeated acquisition of diffraction data as a chemical and biological structural process proceeds following its initiation This opens up completely new studies from timescales ranging from the sub picosecond at the fastest through all the time domains up to kiloseconds for the slower molecular processes Scientific and Technical Aerospace Reports, 1992 **Atomic and Molecular Spectroscopy** Sune Svanberg, 2012-12-06 Atomic and molecular spectroscopy has provided basic information leading to the development of quantum mechanics and to the understanding of the building blocks of matter It continues to provide further insight into the statics and dynamics of the microcosmos and provides the means for testing new concepts and computational methods The results of atomic and molecular spectroscopy are of great importance in astrophysics plasma and laser physics The rapidly growing field of spectroscopic applications has made considerable impact on many disciplines including medicine environmental protection chemical processing and energy research In particular the techniques of electron and laser spectroscopy the subjects of the 1981 Nobel prize in physics have contributed much to the analytical potential of spectroscopy This textbook on Atomic and Molecular Spectroscopy has been prepared to provide an overview of modern spectroscopic methods It is intended to serve as a text for a course on the subject for final year undergraduate physics students or graduate students It should also be useful for students of astrophysics and chemistry The text has evolved from courses on atomic and molecular spectroscopy given by the author since 1975 at Chalmers University of Technology and at the Lund Institute of Technology References are given to important books and review articles which allow

more detailed studies of different aspects of atomic and molecular spectroscopy No attempt has been made to cover all important references nor have priority aspects been systematically considered *Multiphoton Processes and Attosecond Physics* Kaoru Yamanouchi, Midorikawa Katsumi, 2012-08-15 Recent advances in ultrashort pulsed laser technology have opened new frontiers in atomic molecular and optical sciences The 12th International Conference on Multiphoton Processes ICOMP12 and the 3rd International Conference on Attosecond Physics ATTO3 held jointly in Sapporo Japan during July 3 8 showcased studies at the forefront of research on multiphoton processes and attosecond physics This book summarizes presentations and discussions from these two conferences **X-Ray Microscopy III** Alan G. Michette, Graeme R. Morrison, Christopher J. Buckley, 2013-06-05 The growth of interest and research activity in X ray microscopy is reflected in the increasing size and scope of a related series of international conferences the latest of which XRM90 was held at King's College London 3 7 September 1990 with over 130 delegates Previous conferences in Gottingen and Brookhaven resulted in books in the Springer Series in Optical Sciences and this volume the proceedings of XRM90 maintains this tradition Because of the large number of papers their lengths were strictly limited and while most papers can be directly identified with conference presentations in a few cases those on similar topics by the same authors have been combined into a longer paper to allow better use of the space The book is divided into six parts with Parts I to VI covering the major areas of interest at the conference In Part I are two overviews Ron Burge presented the opening paper of the conference while the closing summary contribution by Janos Kirz is included here as a comprehensive introduction to the remainder of the book Part II covers developments in X ray sources and optics The high average brightnesses of synchrotron radiation sources have made many applications possible while the more convenient laboratory based plasma sources offer much promise for the future Several contributions report significant advances in X ray optics which must clearly continue fully to exploit the latest sources
