Climbing And Walking Robots And The Support Technologies For Mobile Machines Mohammad Osman Tokhi, O Tosun, Gurvinder S Virk, H L Akin, 2009-08-26 This book provides state of the art scientific and engineering research findings and developments in the area of mobile robotics and associated support technologies The book contains peer reviewed articles presented at the CLAWAR 2008 conference Robots are no longer confined to industrial manufacturing environments with a great deal of interest being invested in the use of robots outside the factory environment The CLAWAR conference series established as a high profile international event acts as a platform for the dissemination of research and development findings and supports such a trend to address the current interest in mobile robotics in meeting the needs of mankind in various sectors of the society These include personal care public health and services in the domestic public and industrial environments The editors of the book have extensive research experience and publications in the area of robotics specifically in mobile robotics and their experience is reflected in the careful editing of the contents in the book Advances in Robot Kinematics and Computational Geometry Jadran Lenarčič, Bahram Ravani, 2013-06-29 Recently research in robot kinematics has attracted researchers with different theoretical profiles and backgrounds such as mechanical and electrical engineering computer science and mathematics It includes topics and problems that are typical for this area and cannot easily be met elsewhere As a result a specialised scientific community has developed concentrating its interest in a broad class of problems in this area and representing a conglomeration of disciplines including mechanics theory of systems algebra and others Usually kinematics is referred to as the branch of mechanics which treats motion of a body without regard to the forces and moments that cause it In robotics kinematics studies the motion of robots for programming control and design purposes It deals with the spatial positions orientations velocities and accelerations of the robotic mechanisms and objects to be manipulated in a robot workspace The objective is to find the most effective mathematical forms for mapping between various types of coordinate systems methods to minimise the numerical complexity of algorithms for real time control schemes and to discover and visualise analytical tools for understanding and evaluation of motion properties of various mechanisms used in a robotic system Human and Machine Locomotion A. Morecki, K.J. Waldron, 2014-05-04 This book covers the state of the art in both biological and artificial legged locomotion systems The seven chapters focus on topics ranging from very detailed modelling of the musculo skeletal system through mathematical modelling and simulation to theories applicable to locomotion mechanics and control The final two chapters deal with the mechanics control and design of artificial legged locomotion systems **Autonomous Robot Vehicles** Ingemar J. Cox, Gordon T. Wilfong, 2012-12-06 Autonomous robot vehicles are vehicles capable of intelligent motion and action without requiring either a guide or teleoperator control The recent surge of interest in this subject will grow even further as their potential applications increase Autonomous vehicles are currently being studied for use as reconnaissance exploratory vehicles for planetary exploration undersea land and air environments remote repair and maintenance material handling systems for offices and

factories and even intelligent wheelchairs for the disabled This reference is the first to deal directly with the unique and fundamental problems and recent progress associated with autonomous vehicles The editors have assembled and combined significant material from a multitude of sources and in effect now conveniently provide a coherent organization to a previously scattered and ill defined field *International Symposium on History of Machines and Mechanisms Proceedings HMM 2000* Marco Ceccarelli, 2013-11-11 The International Symposium on History of Machines and Mechanisms is a new initiative to promote explicitly researches and publications in the field of the History of TMM Theory of Machines and Mechanisms It was held at the University of Cassino Italy from 11 to 13 May 2000 The Symposium was devoted mainly to the technical aspects of historical developments and therefore it has been addressed mainly to the IFToMM Community In fact most the authors of the contributed papers are experts in TMM and related topics This has been indeed a challenge convincing technical experts to go further in depth into the background of their topics of expertise We have received a very positive response as can be seen by the fact that these Proceedings contain contributions by authors from all around the world We received about 50 papers and after review about 40 papers were accepted for both presentation and publishing in the Proceedings This means also that the History of TMM is of interest everywhere and indeed an in depth knowledge of the past can be of great help in working on the present and in shaping the future with new ideas I believe that a reader will take advantage of the papers in these Proceedings with further satisfaction and motivation for her or his work historical or not These papers cover the wide field of the History of Mechanical Engineering and particularly the History of TMM

Michael McCarthy, 2000-04-26 An introduction to the mathematical theory of design for articulated mechanical systems known as linkages This book will be useful to mathematics engineering and computer science departments that teach courses on mathematical modelling of robotics and other articulated mechanical systems

Walking Machines D. J. Todd, 2013-03-08 The first chapter of this book traces the history of the development of walking machines from the original ideas of man amplifiers and military rough ground transport to today s diverse academic and industrial research and development projects It concludes with a brief account of research on other unusual methods of locomotion The heart of the book is the next three chapters on the theory and engineering of legged robots Chapter 2 presents the basics of land loco motion going on to consider the energetics of legged movement and the description and classification of gaits Chapter 3 dealing with the mechanics of legged vehicles goes into leg number and arrangement and discusses mechanical design and actuation methods Chapter 4 deals with analysis and control describing the aims of control theory and the methods of modelling and control which have been used for both highly dynamic robots and multi legged machines Having dealt with the theory of control it is necessary to discuss the computing system on which control is to be implemented This is done in Chapter 5 which covers architectures sensing algorithms and programming languages Chapter 6 brings together the threads of the theory and engineering discussed in earlier chapters and summarizes the current

walking machine research projects Finally the applications both actual and potential of legged locomotion are described

Fundamentals of Robotic Mechanical Systems Jorge Angeles,2013-03-09 Mechanical engineering an engineering discipline borne of the needs of the industrial revolution is once again asked to do its substantial share in the call for industrial renewal The general call is urgent as we face profound issues of productivity and competitiveness that require engineering solutions among others The Mechanical Engineering Series features graduate texts and research monographs intended to address the need for information in contemporary areas of mechanical engineering The series is conceived as a comprehensive one that covers a broad range of concentrations important to mechanical engineering graduate education and research We are fortunate to have a distinguished roster of consulting editors on the advisory board each an expert in one of the areas of concentration The names of the consulting editors are listed on the next page of this volume The areas of concentration are applied mechanics biomechanics computational mechanics dynamic systems and control energetics mechanics of materials processing thermal science and tribology

Gait Optimization for Multi-legged Walking Robots, with Application to a Lunar Hexapod Daniel Chávez-Clemente,2011 The interest in using legged robots for a variety of terrestrial and space applications has grown steadily since the 1960s At the present time a large fraction of these robots relies on electric motors at the joints to achieve mobility The load distributions inherent to walking coupled with design constraints can cause the motors to operate near their maximum torque capabilities or even reach saturation This is especially true in applications like space exploration where critical mass and power constraints limit the size of the actuators Consequently these robots can benefit greatly from motion optimization algorithms that guarantee successful walking with maximum margin to saturation Previous gait optimization techniques have emphasized minimization of power requirements but have not addressed the problem of saturation directly This dissertation describes gait optimization techniques specifically designed to enable operation as far as possible from saturation during walking The benefits include increasing the payload mass preserving actuation capabilities to react to unforeseen events preventing damage to hardware due to excessive loading and reducing the size of the motors The techniques developed in this work follow the approach of optimizing a reference gait one move at a time As a result they are applicable to a large variety of purpose specific gaits as well as to the more general problem of single pose optimization for multi limbed walking and climbing robots The first part of this work explores a zero interaction technique that was formulated to increase the margin to saturation through optimal displacements of the robot's body in 3D space Zero interaction occurs when the robot applies forces only to sustain its weight without squeezing the ground The optimization

presented here produces a swaying motion of the body while preserving the original footfall locations. Optimal displacements are found by solving a nonlinear optimization problem using sequential quadratic programming (SQP). Improvements of over 20% in the margin to saturation throughout the gait were achieved with this approach in simulation and experiments. The zero interaction technique is the safest in the absence of precise knowledge of the contact mechanical properties and friction coefficients. The second part of the dissertation presents a technique that uses the null space of contact forces to achieve greater saturation margins. Interaction forces can significantly contribute to saturation prevention by redirecting the net contact force relative to critical joints. A method to obtain the optimal distribution of forces for a given pose via linear programming (LP) is presented. This can be applied directly to the reference gait or combined with swaying motion. Improvements of up to 60% were observed in simulation by combining the null space with sway. The zero interaction technique was implemented and validated on the All Terrain Hex Limbed Extra Terrestrial Explorer (ATHLETE), a hexapod robot developed by NASA for the transport of heavy cargo on the surface of the moon. Experiments with ATHLETE were conducted at the Jet Propulsion Laboratory in Pasadena, California, confirming the benefits predicted in simulation. The results of these experiments are also presented and discussed in this dissertation.

Intelligent Autonomous Systems 6 Enrico Pagello, 2000. After a long period in which the research focused mainly on industrial robotics, nowadays scientists aim to build machines able to act autonomously in unstructured domains and to interface friendly with humans while performing intelligently their assigned tasks. Such intelligent autonomous systems are now being intensively developed and are ready to be applied to every field from social life to modern enterprises. We believe the following years will be increasingly characterised by their extensive use. This is dramatically changing the whole scenario of human society.

Introduction to the Mechanics of Space Robots Giancarlo Genta, 2011-10-27. Based on lecture notes on a space robotics course, this book offers a pedagogical introduction to the mechanics of space robots. After presenting an overview of the environments and conditions space robots have to work in, the author discusses a variety of manipulatory devices robots may use to perform their tasks. This is followed by a discussion of robot mobility in these environments and the various technical approaches. The last two chapters are dedicated to actuators, sensors, and power systems used in space robots. This book fills a gap in the space technology literature and will be useful for students and for those who have an interest in the broad and highly interdisciplinary field of space robotics and in particular in its mechanical aspects.
