Macroscopic Quantum Tunneling of the Magnetic Moment Eugene M. Chudnovsky, Javier Tejada, 1998-08-28 This is the first book to present a coherent theoretical and experimental treatment of the rapidly developing field of macroscopic quantum tunneling of the magnetic moment The theory is based on the concept of the magnetic instanton and its renormalization by the dissipative environment The book includes discussions of the tunneling of magnetic moment in small ferromagnetic grains tunneling of the Néel vector in antiferromagnetic grains quantum nucleation of magnetic domains and quantum depinning of domain walls The experimental part collects the majority of recent data that are or may be relevant to spin tunneling Among the topics described are low temperature magnetic relaxation and its interpretation in various systems experiments on single particles and mesoscopic wires and resonant spin tunneling in molecular magnets This study of an important new field in condensed matter physics by two leading contributors to the subject will be of interest to theorists and experimentalists

Experiments investigating the process of macroscopic quantum tunneling in a moderately damped resistively shunted Josephson junction are described followed by a discussion of experiments performed on very small capacitance normal metal tunnel junctions The experiments on the resistively shunted Josephson junction were designed to investigate a quantum process that of the tunneling of the Josephson phase variable under a potential barrier in a system in which dissipation plays a major role in the dynamics of motion All the parameters of the junction were measured using the classical phenomena of

thermal activation and resonant activation Theoretical predictions are compared with the experimental results showing good agreement with no adjustable parameters the tunneling rate in the moderately damped Q almost equal to 1 junction is seen to be reduced by a factor of 300 from that predicted for an undamped junction The phase is seen to be a good quantum mechanical variable The experiments on small capacitance tunnel junctions extend the measurements on the larger area Josephson junctions from the region in which the phase variable has a fairly well defined value i.e. its wavefunction has a narrow width to the region where its value is almost completely unknown The charge on the junction becomes well defined and is predicted to quantize the current through the junction giving rise to the Coulomb blockade at low bias I present the first clear observation of the Coulomb blockade in single junctions The electrical environment of the tunnel junction however strongly affects the behavior of the junction higher resistance leads are observed to greatly sharpen the Coulomb blockade over that seen with lower resistance leads I present theoretical descriptions of how the environment influences the junctions comparisons with the experimental results are in reasonable agreement

The Quantum Challenge George Greenstein, Arthur Zajonc, 2006 The Quantum Challenge Second Edition is an engaging and thorough treatment of the extraordinary phenomena of quantum mechanics and of the enormous challenge they present to our conception of the physical world Traditionally the thrill of grappling with such issues is reserved for practicing scientists while physical science mathematics and engineering students are often isolated from these inspiring questions This book was written to remove this isolation
