What is seismic energy?

Seismic energy is the energy that travels through the Earth during an earthquake. It is the energy that causes the ground to shake. This energy is released from the focus of the earthquake and travels outwards in all directions. The energy is carried by seismic waves, which are the vibrations that travel through the Earth's interior and along its surface.

What are seismic waves?

Seismic waves are the vibrations that travel through the Earth's interior and along its surface. They are the energy that is released from the focus of the earthquake and travels outwards in all directions. There are three main types of seismic waves: P-waves, S-waves, and surface waves. P-waves are the fastest and travel through the Earth's interior. S-waves are the second fastest and travel through the Earth's interior. Surface waves are the slowest and travel along the Earth's surface.

How do seismic waves propagate?

Seismic waves propagate by vibrating the particles of the medium through which they travel. P-waves are longitudinal waves, meaning that the particles vibrate parallel to the direction of wave travel. S-waves are transverse waves, meaning that the particles vibrate perpendicular to the direction of wave travel. Surface waves are a combination of P-waves and S-waves, meaning that the particles vibrate both parallel and perpendicular to the direction of wave travel.
