Multisensor Surveillance Systems Gian Luca Foresti, Carlo S. Regazzoni, Pramod K.

Varshney, 2012-12-06 Monitoring of public and private sites is increasingly becoming a very important and critical issue especially after the recent flurry of terrorist attacks including the one on the World Trade Center in September 2001. It is therefore imperative that effective multisensor surveillance systems be developed to protect the society from similar attacks in the future. The new generation of surveillance systems to be developed have a specific requirement: they must be able to automatically identify criminal and terrorist activity without sacrificing individual privacy to the extent possible. Privacy laws concerning monitoring and surveillance systems vary from country to country but in general they try to protect the privacy of their citizens. Monitoring and visual surveillance has numerous other applications. It can be employed to help invalids or handicapped and to monitor the activities of elderly people. It can be used to monitor large events such as sporting events as well. Nowadays monitoring is employed in several different contexts including transport applications such as monitoring of railway stations and airports, dangerous environments like nuclear facilities or traffic flows on roads and bridges. The latest generation of surveillance systems mainly rely on hybrid analog/digital or completely digital video communications and processing methods and take advantage of the greater flexibility offered by video processing algorithms that are capable of focusing a human operator's attention on a set of interesting situations.

Management, 1986 *Non-deterministic Concurrent Logic Programming in Pandora* Reem Bahgat, 1993 This monograph is the first comprehensive study of the design, application and implementation of Pandora, a new parallel logic programming language. Pandora combines stream and parallelism with non-determinism in a unified and efficient manner. As a result, it provides a programming paradigm of non-deterministic concurrent communicating processes which opens up interesting application areas that cannot conveniently be expressed in existing logic programming languages. The author describes the use of Pandora for constraint programming, solving resource allocation problems, heuristic search and distributed discrete event simulation. The final chapters describe in detail the implementation of Pandora on single as well as multi-processor architectures. The volume is aimed at the community of logic programming students and professionals as well as researchers and professionals in artificial intelligence. It will also be of great interest to researchers in programming language design and parallel processing.
