Macro Processors Cambridge Computer Science Texts:

Macro Processors A. J. Cole, 1981-11-26 *Macro Processors* A. J. Cole, 1981-11-26 Computing Systems Hardware M. Wells, 1976-08-26 The aim of this text is to introduce the concepts which underlie the structure of computing systems The text moves from basic principles to descriptions of current equipment with an emphasis on the economic factors that arise as a consequence of the internal design of individual units This book is intended for students in the second year of course s which include a substantial amount of computer science **Text Processing** A. Colin Day, 1984-07-12 Introduction to Programming Languages Barron, 1977-04-07 *Categories and Computer Science* R. F. C. Walters, Richard F. Walters, 1991 Category theory has become increasingly important and popular in computer science and many universities now have introductions to category theory as part of their courses for undergraduate computer scientists The author is a respected category theorist and has based this textbook on a course given over the last few years at the University of Sydney The theory is developed in a straightforward way and is enriched with many examples from computer science Thus this book meets the needs of undergraduate computer scientists and yet retains a level of mathematical correctness that will broaden its appeal to include students of mathematics new to category theory **Computer Mathematics** D. J. Cooke, H. E. Bez, 1984-05-24 Computing is an exact science and the systematic study of any aspect necessarily involves the use of mathematical models Moreover the rate at which the subject is evolving demands a facility for developing new mathematical systems to keep pace with new computing systems and this requires an appreciation of how mathematics works An understanding of the underlying mathematical structure facilitates the construction of suitable computer programs to perform computations Assuming no specific knowledge of mathematics the authors describe all the basic concepts required and progress from sets rather than numbers through a variety of algebraic structures that permit the precise description specification and subsequent analysis of many problems in computing The material included provides the essential mathematical foundations for core topics of computer science and extends into the areas of language theory abstract machine theory and computer geometry Computer Mathematics will be of interest to undergraduate students of computer science and mathematics post graduate computing conversion course students and computer professionals who need an introduction to the mathematics that underpins computer science theory **Science Books & Films**, 1977 *An Introduction to the Uses of Computers* F. J. M. Laver, 1976-07-08 *Modelling of Computer and Communication Systems* I. Mitrani, 1987-10 This 1987 book is a self contained text on the probabilistic modelling method It provides the reader with an understanding of the available results as well as with examples of their application The only background assumed is a knowledge of basic calculus The necessary fundamentals of probability are presented followed by an introduction to stochastic processes The remainder of the book is devoted to the treatment of various single station and their application to uni programmed and multi programmed systems and local and wide area networks Both exact and approximate solution

methods are discussed with as much emphasis on explaining the ideas and providing information as on derivations and proofs
This book will still be of use for anyone with an interest in the history of computer science **A Practical Introduction to**

Concurrent Programming C. R. Snow,1992 This textbook is designed as a first book on concurrent programming for
computer science undergraduates and provides a comprehensive introduction to the problems of concurrency Concurrency is
of vital importance in many areas of computer science particularly in operating systems It is also increasingly being taught in
undergraduate courses The book builds on the student s familiarity with sequential programming in a high level language
which will make it very accessible to computer science students The book is concerned mainly with the high level aspects of
concurrency which will be equally applicable to traditional time sliced or more recent truly parallel systems Subject
Guide to Books in Print ,1991 **Recursion Via Pascal** Jeffrey Soden Rohl,1984-07-26 This book is devoted to recursion in

programming the technique by which the solution to a problem is expressed partly in terms of the solution to a simpler
version of the same problem Ultimately the solution to the simplest version must be given explicitly In functional
programming recursion has received its full due since it is quite often the only repetitive construct However the
programming language used here is Pascal and the examples have been chosen accordingly It makes an interesting contrast
with the use of recursion in functional and logic programming The early chapters consider simple linear recursion using
examples such as finding the highest common factor of a pair of numbers and processing linked lists Subsequent chapters
move up through binary recursion with examples which include the Towers of Hanoi problem and symbolic differentiation to
general recursion The book contains well over 100 examples **Programming for Software Sharing** D.T.

Muxworthy,2012-12-06 Most computer users are familiar with the problems of sharing software with others and the transfer
of programs from one computing environment to another Software represents an ever increasing proportion of the cost of
computing and these costs tend to nullify all the economic advantages flowing from the wider availability of cheap hardware
Years ago it was hoped that the widespread use of high level programming languages would help in alleviating the problems
of software production by increasing productivity and by making it simpler for users with similar problems to be able to use
the same programs possibly on different types of machines It is a common experience that in practice this simple optimism
has proved to be unfounded It was these considerations which led us in 1979 to organize a two week course on Programming

for Software Sharing at the European Community Joint Research Centre Ispra Establishment Italy forming part of the regular series of Ispra Courses With prominent invited lecturers local contributions and through discussion sessions we examined with an audience from many countries the problems involved in the sharing and transfer of software as well as suggesting ways of overcoming them In our local environment we are faced daily with three problems both from engagements in software exchange in the scientific technical field on a Europe wide or world wide basis and from work with programming techniques and contributions to the international standardization process
