Macromolecules H.G. Elias, 2013-11-11 The second edition of this textbook is identical with its fourth German edition and it thus has the same goals precise definition of basic phenomena a broad survey of the whole field integrated representation of chemistry physics and technology and a balanced treatment of facts and comprehension The book thus intends to bridge the gap between the often oversimplified introductory textbooks and the highly specialized texts and monographs that cover only parts of macromolecular science The text intends to survey the whole field of macromolecular science Its organization results from the following considerations The chemical structure of macromolecular compounds

Photoinitiators offers a wide ranging overview of existing photoinitiators and photoinitiating systems and their uses in ever growing green technologies The authors noted experts on the topic provide a concise review of the backgrounds in photopolymerization and photochemistry explain the available structures and examine the excited state properties involved mechanisms and structure reactivity and efficiency relationships The text also contains information on the latest developments and trends in the design of novel tailor made systems The book explores the role of current systems in existing

and emerging processes and applications Comprehensive in scope it covers polymerization of thick samples and in shadow areas polymerization under LEDs NIR light induced thermal polymerization photoinitiators for novel specific and improved properties and much more Written by an experienced and internationally renowned team of authors this important book Provides detailed information about excited state processes mechanisms and design of efficient photoinitiator systems Discusses the performance of photoinitiators of polymerization by numerous examples of reactions and application Includes information on industrial applications Presents a review of current developments and challenges Offers an introduction to the background information necessary to understand the field The role played by photoinitiators in a variety of different polymerization reactions Written for polymer chemists photochemists and materials scientists Photoinitiators will also earn a place in the libraries of photochemists seeking an authoritative one stop guide to the processes mechanisms and industrial applications of photoinitiators

New Methods for Polymer Synthesis W.J. Mijs, 2013-06-29 The art and science of macromolecular architecture is based on synthesis analysis processing and evaluation of physical properties of polymers The growing specificity of available synthetic methods and the increasing refinement of analytical and physical analysis are gradually providing a deeper insight into structure property relationships of polymers upon which many applications can be based This book deals with recent methods for polymer synthesis Those that lead to specific structures have been selected especially Background mechanism scope and limitations and illustrative procedures are given for each method With this layout the editor hopes that the book will provide a practical guideline for the synthetic polymer chemist in industry or at a university graduate school on how to apply the methods in the design of new polymer structures The editor is grateful to the authors not only for their contributions containing interesting new developments in polymer synthesis but also for the way they have fitted their text into the general framework of the book The elegant chemistry described in the following chapters will it is hoped inspire more organic chemists to apply their skills to polymer synthesis where the beauty of organic chemistry in terms of structural control and reactivity may be even more apparent than in the low molecular field

Nano-Enhanced and Nanostructured Polymer-Based Membranes for Energy Applications Maria Giovanna Buonomenna, 2022-01-22 There is a growing need for better membranes in several emerging application fields especially those related to energy conversion and storage as well as to water treatment and recycling Processability is an important functional property often ignored especially in the early discovery phase for new materials but it should be one of the most important properties that needs to be considered in the development of better membrane materials Useful membrane materials have to be capable of being formed into thin membranes in particular for membrane gas separation water treatment and desalination and then packaged into large area membrane modules All gas separation membranes that are in current commercial use are based on polymers which are solution processable This book intends to deal with composite in most cases hybrid polymer based membranes for three separate application fields energy conversion energy storage and water treatment and recovery Each chapter will

explain clearly the various membrane processes then go on to discuss in detail the corresponding advanced membranes used. The logic that lies behind this is that you have to understand the process in order to develop new high performance membranes. By taking this approach the author aims to overcome the disconnection that currently exists between membrane materials scientists and industrial process engineers. Discusses interdisciplinary content by a single author approaching synthesis and development of materials from the perspective of their processability. Describes the novel aspects of membrane science that is related to energy storage conversion and wastewater treatment. Presents an emphasis on scientific results which have an impact on real applications in terms of renewable and clean energy challenges.

Photoinitiators for Polymer Synthesis Jean-Pierre Fouassier, Jacques Lalevée, 2013-01-02. Photoinitiating systems for polymerization reactions are largely encountered in a variety of traditional and high tech sectors such as radiation curing laser imaging micro electronics optics and medicine. This book extensively covers radical and nonradical photoinitiating systems and is divided into four parts: Basic principles in photopolymerization reactions; Radical photoinitiating systems; Nonradical photoinitiating systems; Reactivity of the photoinitiating system. The four parts present the basic concepts of photopolymerization reactions, review all of the available photoinitiating systems and deliver a thorough description of the encountered mechanisms. A large amount of experimental and theoretical data has been collected herein. This book allows the reader to gain a clear understanding by providing a general discussion of the photochemistry and chemistry involved. The most recent and exciting developments as well as the promising prospects for new applications are outlined.

Nanostructured Polymer Blends Sabu Thomas, Robert Shanks, Sarath Chandran, 2013-11-28. Over 30% of commercial polymers are blends or alloys of one kind or another. Nanostructured blends offer the scientist or plastics engineer a new range of possibilities with characteristics including thermodynamic stability, the potential to improve material transparency, creep and solvent resistance, the potential to simultaneously increase tensile strength and ductility, superior rheological properties and relatively low cost. Nanostructured Polymer Blends opens up immense structural possibilities via chemical and mechanical modifications that generate novel properties and functions and high performance characteristics at a low cost. The emerging applications of these new materials cover a wide range of industry sectors encompassing the coatings and adhesives industry, electronics, energy, photovoltaics, aerospace and medical devices where polymer blends provide innovations in biocompatible materials. This book explains the science of nanostructure formation and the nature of interphase formations, demystifies the design of nanostructured blends to achieve specific properties and introduces the applications for this important new class of nanomaterial. All the key topics related to recent advances in blends are covered: IPNs, phase morphologies, composites and nanocomposites, nanostructure formation, the chemistry and structure of additives etc. Introduces the science and technology of nanostructured polymer blends and the procedures involved in melt blending and chemical blending to produce new materials with specific performance characteristics. Unlocks the potential of nanostructured polymer blends for applications.

across sectors including electronics energy photovoltaics aerospace automotive and medical devices biocompatible polymers Explains the performance benefits in areas including rheological properties thermodynamic stability material transparency solvent resistance etc
