Kidney Inflammation, Injury and Regeneration Patrick C. Baer,Benjamin Koch,Helmut Geiger,2020-04-03 Acute kidney injury AKI is still associated with high morbidity and mortality incidence rates and also bears an elevated risk of subsequent chronic kidney disease Although the kidney has a remarkable capacity for regeneration after injury and may recover completely depending on the type of renal lesions the options for clinical intervention are restricted to fluid management and extracorporeal kidney support The development of novel therapies to prevent AKI to improve renal regeneration capacity after AKI and to preserve renal function is urgently needed The Special Issue covers research articles that investigated the molecular mechanisms of inflammation and injury during different renal pathologies renal regeneration diagnostics using new biomarkers and the effects of different stimuli like medication or bacterial components on isolated renal cells or in vivo models The Special Issue contains important reviews that consider the current knowledge of cell death and regeneration inflammation and the molecular mechanisms of kidney diseases In addition the potential of cell based therapy approaches that use mesenchymal stromal stem cells or their derivatives is summarized This edition is complemented by reviews that deal with the current data situation on other specific topics like diabetes and diabetic nephropathy or new therapeutic targets

Interphase Between Aging and Neurodegenerative Diseases Walter E. Müller, Anne Eckert, P. Hemachandra Reddy, 2020-01-21 The purpose of this Research Topic is to discuss the latest developments in aging and neurodegenerative diseases Aging represents the major risk factor of the two most relevant neurodegenerative diseases Parkinson's disease PD and Alzheimer's disease AD It is generally accepted that symptoms of PD correlate with the severity of degeneration of dopaminergic substantia nigra neurons In most cases neuronal loss during aging is not sufficient to cause clinical symptoms but only leads to a preclinical state of PD However in a small number of our population neurodegeneration by aging gets accelerated by individual e.g. brain injuries environmental e.g. toxins and genetic e.g. mutations of the alpha synuclein gene factors to reach the critical threshold for clinical symptoms during lifetime Thus neurodegeneration in PD appears to represent the common final pathway of normal brain aging and all other risk factors including genetics and the accumulation of the neurotoxic alpha synuclein protein While aging alone is generally agreed to be sufficient for at least the preclinical state of PD the situation in AD seems to be different Aging as the major and well documented risk factor of AD has been neglected for decades Biochemical mechanisms of brain aging and the cognitive deficits of normal brain aging were seen as two not related and independent processes not related to AD AD has always been characterized for decades by the presence of histopathological alterations extracellular amyloid containing plaques and intracellular tangles of hyperphosphorylated tau protein by neurodegeneration synaptic deficits and finally neuronal loss as well as by severe cognitive deficits clinically often accompanied by neuropsychiatric symptoms like delusions as already described in the first famous patient Auguste D at the Psychiatric Hospital of Frankfurt If or if not one or both of the two histopathological hallmarks play a causative role remains unclear until now The discovery of homozygotic risk genes in most of the very rare probably less than 1% cases of early onset AD which share increased production of amyloid A as one but probably not the only one common property led to the hypothesis of A as the major causative factor for the development of AD It was neglected that plaques density in the brain of AD patients did not correlate with presence and severity of clinical symptoms while synaptic deficits did so even in first observations already published many years ago Based on the Amyloid hypothesis many drug treatments to remove A plaques were developed Even if all seemed to remove A to some extent all strategies failed to improve the symptoms of dementia Thus other concepts to explain the development of clinical symptoms of AD over time are needed These should include the brain aging process not only as a statistical but also as a causative

contributing factor These concepts should not only rely on cell or animal models but should much more take into account the disease and the patients A closer look at the situation in PD will certainly be helpful
