David P. Fleming, 1969 Transient Electro-Thermal Modeling on Power Semiconductor Devices Tanya Kirilova

Gachovska, Jerry Hudgins, Bin Du, Enrico Santi, 2022-06-01 This book presents physics based electro thermal models of bipolar power semiconductor devices including their packages and describes their implementation in MATLAB and Simulink It is a

continuation of our first book *Modeling of Bipolar Power Semiconductor Devices* The device electrical models are developed by subdividing the devices into different regions and the operations in each region along with the interactions at the interfaces are analyzed using the basic semiconductor physics equations that govern device behavior The Fourier series solution is used to solve the ambipolar diffusion equation in the lightly doped drift region of the devices In addition to the external electrical characteristics internal physical and electrical information such as junction voltages and carrier distribution in different regions of the device can be obtained using the models The instantaneous dissipated power calculated using the electrical device models serves as input to the thermal model RC network with constant and nonconstant thermal resistance and thermal heat capacity or Fourier thermal model of the entire module or package which computes the junction temperature of the device Once an updated junction temperature is calculated the temperature dependent semiconductor material parameters are re calculated and used with the device electrical model in the next time step of the simulation The physics based electro thermal models can be used for optimizing device and package design and also for validating extracted parameters of the devices The thermal model can be used alone for monitoring the junction temperature of a power semiconductor device and the resulting simulation results used as an indicator of the health and reliability of the semiconductor power device

Reflections on Power Prediction Modeling of Conventional High-Speed Craft Dejan Radojčić, 2018-08-25 This SpringerBrief focuses on modeling and power evaluation of high speed craft The various power prediction methods a principal design objective for high speed craft of displacement semi displacement and planing type are addressed At the core of the power prediction methods are mathematical models for resistance and propulsion efficiency The models are based on the experimental data of various high speed hull and propeller series The regression analysis and artificial neural network ANN methods are used as an extraction tool for this kind of mathematical models A variety of mathematical models of this type are discussed in the book Once these mathematical models have been developed and validated they can be readily programmed into software tools thereby enabling the parametric analyses required for the optimization of a high speed craft design This book provides the foundational reference for these software tools and their use in the design of high speed craft High speed craft are very different from conventional ships Current professional literature leaves a gap in the documentation of best design practices for high speed craft This book is aimed at naval architects who design and develop various types of high speed vessels

On power system automation: Christoph Brosinsky, 2023-01-01 The ubiquitous digital transformation also influences power system operation Emerging real time applications in information IT and operational technology OT provide new opportunities to address the increasingly demanding power system operation imposed by the progressing energy transition This IT OT convergence is epitomised by the novel Digital Twin DT concept By integrating sensor data into analytical models and aligning the model states with the observed system a power system DT can be created As a result a validated high fidelity model is derived which can be applied within the next generation of energy

management systems EMS to support power system operation By providing a consistent and maintainable data model the modular DT centric EMS proposed in this work addresses several key requirements of modern EMS architectures It increases the situation awareness in the control room enables the implementation of model maintenance routines and facilitates automation approaches while raising the confidence into operational decisions deduced from the validated model This gain in trust contributes to the digital transformation and enables a higher degree of power system automation By considering operational planning and power system operation processes a direct link to practice is ensured The feasibility of the concept is examined by numerical case studies
