## Southwest Principal Aquifers Regional Ground-Water Quality Assessment

The National Water Quality Assessment (NWQA) Program of the U.S. Geological Survey is conducting a regional analysis of water quality in the principal aquifers in the southwestern United States. The Southwest Principal Aquifers (SWPA) study is building a better understanding of the vulnerability and sustainability of these aquifers in the region to ground-water contamination by synthesizing the available knowledge of ground-water quality and trends in 17 States previously included in the NWQA Program (fig. 1). The improved understanding of aquifer vulnerability and sustainability in combination with data sets defined on page 10 is providing a better understanding of why and how contaminants enter aquifers and protect the quality of ground-water resources. The NWQA Program is performing routine regional sampling from the major principal aquifers across the western, Central, and eastern U.S.

These 17 aquifers include about 40 percent of the 400,000 sq. miles used for the greatest ground-water supply for urban and agricultural communities. In several States, these aquifers provide base flow to streams that support important aquatic and riparian habitats. When aggregated across the study area, the SWPA aquifers comprise more than 50 percent of the principal aquifers of the United States. The Texas and Orange Texas (OT) aquifers in California, Nevada, Utah, and Arizona; the San Joaquin aquifer in most of Kern, Fresno, and Coahuila; and the Central Valley aquifer and the Central Valley aquifer system in California (fig. 1); U.S. Geological Survey, 2001a).

About 40 million people live in the SWPA study area. It supplies a third of the Nation's electricity, mostly to urban, metropolitan areas. Just after its total agricultural communities that used about 10.4 million acres of cropland (U.S. Geological Survey, 2001b). These land uses require much water for irrigating, urban uses, and

## **Regional Ground Water Quality:**

*Regional Ground-Water Quality* William M. Alley, 1993-06-15 Ground water serves as the main source of drinking water for 50% of the United States as a whole and for 97% of rural populations in particular. In addition to public concern with point sources of contamination such as landfills and hazardous waste disposal sites, current attention has now come to focus on the overall quality of ground water resources. *Regional Ground Water Quality* offers the first detailed guidance for conducting ground water quality investigations in a regional context. This exceptional volume combines hydrogeologic and geochemical principles as well as statistical principles within a unique conceptual framework that helps readers produce efficient, meaningful and successful ground water assessments. *Regional Ground Water Quality* will be a valuable resource when first approaching a regional scale study and when designing specific regional scale studies. Throughout the book, topics emphasize the value of studying regional ground water quality at multiple spatial and temporal scales. Up to date coverage of essential processes and methodologies includes multi scale design concepts for regional ground water quality studies, the fate and transport of organic and inorganic materials including nitrates, pesticides, pathogens, acid precipitation, natural radionuclides, saltwater intrusion and problems in karst aquifers, basic concepts of organic and inorganic chemistry, a review of environmental isotopes and geochemical modeling, statistical concepts for ground water quality surveys and geostatistical analysis, the effects of surface water ground water interactions on ground water quality, the relationship between ground water quality and land use, regional geochemistry principles. Readers will be brought completely up to date with the latest research in ground water assessments such as novel methods for dating young ground water including the use of CFCs, tritium, helium 3 and krypton 85. The book also examines the uses of organic compounds as time and source markers, ground water vulnerability analyses, applications of subsurface microbiology at the regional scale and design of well water surveys. Invaluable case studies drawn from international projects graphically demonstrate concepts discussed in the book. These case studies describe successful regional ground water assessment efforts conducted in various areas and include a look at the uses and limitations of existing ground water quality data. A first of its kind resource, *Regional Ground Water Quality* will be essential reading for scientists and engineers in hydrology, water resources, agricultural sciences and environmental sciences. It will also be of interest to engineers and R D personnel in government industry and private consulting as well as to professionals involved with the design and interpretation of studies.

Groundwater is a basic resource for humans and natural ecosystems and is one of the nation's most important natural resources. Groundwater is pumped from wells to supply drinking water to about 130 million U.S. residents and is used in all 50 states. About 40 percent of the nation's public water supply and much of the water used for irrigation is provided by groundwater. Despite the importance of groundwater as one of our most precious natural resources, an organized, effective program to provide an ongoing assessment of the nation's groundwater resources does not exist. With encouragement from the U.S. Congress, the USGS is planning for a new program of regional and national scale assessment of U.S. groundwater resources, thus helping bring new order to its various groundwater resources related activities. The Survey's senior scientists requested advice in regard to the design of such a program. In response, the committee undertook this study in support of developing an improved program relevant to regional and national assessment of groundwater resources. This report is a product of the Committee on USGS Water Resources Research, which provides consensus advice on scientific research and programmatic issues to the Water Resources Division (WRD) of the U.S. Geological Survey (USGS). The committee is one of the groups that work under the auspices of the Water Science and Technology Board of the National Research Council (NRC). The committee considers a variety of topics that are important scientifically and programmatically to the USGS and the nation and it issues reports when appropriate. This report concerns the work of the WRD in science and technology relevant to assessments of groundwater resources on regional and national scales. The USGS has been conducting scientific activity relevant to groundwater resources for over 100 years and as summarized in Appendix A, today groundwater related work occurs throughout the WRD.
